Summer 2012
Exam 1 Solutions

1. The period is proportional to the square root of its length

$$
T \propto \sqrt{L}
$$

Forming a ratio:

$$
\frac{T_{2}}{T_{1}}=\sqrt{\frac{L_{2}}{L_{1}}}
$$

We want $T_{2}=1.5 T_{1}$. Substituting

$$
\begin{aligned}
\frac{1.5 T_{1}}{T_{1}} & =\sqrt{\frac{L_{2}}{L_{1}}} \\
\sqrt{\frac{L_{2}}{L_{1}}} & =1.5 \\
\frac{L_{2}}{L_{1}} & =(1.5)^{2}=2.25
\end{aligned}
$$

2. $60 \frac{\text { miles }}{\text { hour }}=60 \frac{\text { miles }}{\text { hour }} \times \frac{1 \text { hour }}{60 \text { minutes }} \times \frac{1 \text { minute }}{60 \text { seconds }} \times \frac{5280 \text { feet }}{1 \text { mile }}=88 \frac{\text { feet }}{\text { second }}$
3. The definition of average velocity is

$$
v_{x, a v}=\frac{\Delta x}{\Delta t}
$$

where $\Delta x$ is the total distance traveled. For the first part of the trip,

$$
\Delta x_{1}=v_{1} \Delta t=70 \frac{\text { miles }}{\text { hour }} \times \frac{3}{4} \text { hour }=52.5 \text { miles }
$$

For the second part,

$$
\Delta x_{2}=v_{2} \Delta t=50 \frac{\text { miles }}{\text { hour }} \times \frac{1}{2} \text { hour }=25 \text { miles }
$$

Overall,

$$
v_{x, a v}=\frac{\Delta x}{\Delta t}=\frac{52.5 \text { miles }+25 \text { miles }}{0.75 \text { hour }+0.5 \text { hour }}=62 \mathrm{miles} / \mathrm{hour}
$$

4. Use

$$
\begin{aligned}
& v_{f x}^{2}-v_{i x}^{2}=2 a \Delta x \\
& a=\frac{v_{f x}^{2}-v_{i x}^{2}}{2 \Delta x}=\frac{(15 \mathrm{~m} / \mathrm{s})^{2}-(9 \mathrm{~m} / \mathrm{s})^{2}}{2(20 \mathrm{~m})}=3.6 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

5. First find the time it takes for the cage to hit the ground.

$$
\begin{aligned}
\Delta y & =v_{i y} \Delta t+\frac{1}{2} a_{y}(\Delta t)^{2} \\
& =0-\frac{1}{2} g(\Delta t)^{2} \\
\Delta t & =\sqrt{\frac{-2 \Delta y}{g}}=\sqrt{\frac{-2(-25 \mathrm{~m})}{9.8 \mathrm{~m} / \mathrm{s}^{2}}}=2.26 \mathrm{~s}
\end{aligned}
$$

Princess needs to run 3 m in that time.

$$
\begin{aligned}
\Delta x & =v_{i x} \Delta t+\frac{1}{2} a_{x}(\Delta t)^{2} \\
& =0+\frac{1}{2} a_{x}(\Delta t)^{2} \\
a_{x} & =\frac{2 \Delta x}{(\Delta t)^{2}}=\frac{2(3 \mathrm{~m})}{(2.26 \mathrm{~s})^{2}}=1.18 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

6. Solve for the initial speed.

$$
\begin{aligned}
\Delta y & =v_{i y} \Delta t+\frac{1}{2} a_{y}(\Delta t)^{2} \\
& =v_{i y} \Delta t-\frac{1}{2} g(\Delta t)^{2} \\
v_{i y} & =\frac{\Delta y}{\Delta t}+\frac{g \Delta t}{2}=\frac{-37 \mathrm{~m}}{3.7 \mathrm{~s}}+\frac{\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right)(3.7 \mathrm{~s})}{2}=8.13 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

7. Find the components of each vector. For the tee shot

$$
\begin{aligned}
& A_{x}=A \sin 30^{\circ}=(150 \text { yards }) \sin 30^{\circ}=75 \text { yards } \\
& A_{y}=A \cos 30^{\circ}=(150 \text { yards }) \cos 30^{\circ}=130 \text { yards }
\end{aligned}
$$

For the second shot

$$
\begin{aligned}
& B_{x}=-B \sin 45^{\circ}=-(120 \text { yards }) \sin 45^{\circ}=-84.9 \text { yards } \\
& B_{y}=B \cos 45^{\circ}=(120 \text { yards }) \cos 45^{\circ}=84.9 \text { yards }
\end{aligned}
$$

Add like components

$$
\begin{aligned}
& C_{x}=A_{x}+B_{x}=(75 \text { yards })+(-84.9 \text { yards })=-9.9 \text { yards } \\
& C_{y}=A_{y}+B_{y}=(130 \text { yards })+(84.9 \text { yards })=215 \text { yards }
\end{aligned}
$$

The calculator gives

$$
\theta=\tan ^{-1}\left(\frac{215}{-9.9}\right)=-87^{\circ}
$$

Since the $x$-component is negative, we add $180^{\circ}$ to get $93^{\circ}$ or $3^{\circ} \mathrm{W}$ of N .
8. We have

$$
\overrightarrow{\mathbf{A}}+\overrightarrow{\mathbf{B}}+\overrightarrow{\mathbf{C}}=0
$$

Taking components

$$
A_{x}+B_{x}+C_{x}=0 \quad A_{y}+B_{y}+C_{y}=0
$$

Solve for $C_{x}$ and $C_{y}$

$$
C_{x}=-A_{x}-B_{x} \quad C_{y}=-A_{y}-B_{y}
$$

We need the components of $\overrightarrow{\mathbf{A}}$ and $\overrightarrow{\mathbf{B}}$ :

$$
\begin{aligned}
& A_{x}=A \cos \theta_{A}=(50 \mathrm{~N}) \cos 30^{\circ}=43.3 \mathrm{~N} \\
& A_{y}=A \sin \theta_{A}=(50 \mathrm{~N}) \sin 30^{\circ}=25.0 \mathrm{~N}
\end{aligned}
$$

$$
\begin{gathered}
B_{x}=B \cos \theta_{B}=(70 \mathrm{~N}) \cos 90^{\circ}=0 \\
B_{y}=B \sin \theta_{B}=(70 \mathrm{~N}) \sin 90^{\circ}=70.0 \mathrm{~N}
\end{gathered}
$$

Finding the components of $\overrightarrow{\mathbf{C}}$,

$$
\begin{gathered}
C_{x}=-A_{x}-B_{x}=-(43.3 \mathrm{~N})-0=-43.3 \mathrm{~N} \\
C_{y}=-A_{y}-B_{y}=-(25.0 \mathrm{~N})-(70.0 \mathrm{~N})=-95.0 \mathrm{~N}
\end{gathered}
$$

The magnitude of $\overrightarrow{\mathbf{C}}$

$$
C=\sqrt{C_{x}^{2}+C_{y}^{2}}=\sqrt{(-43.3 \mathrm{~N})^{2}+(-95.0 \mathrm{~N})^{2}}=104 \mathrm{~N}
$$

From the calculator

$$
\tan ^{-1}\left(\frac{C_{y}}{C_{x}}\right)=\tan ^{-1}\left(\frac{-95.0 \mathrm{~N}}{-43.3 \mathrm{~N}}\right)=65^{\circ}
$$

But since $C_{x}$ is negative, add $180^{\circ}$ to get $245^{\circ}$.
9. The relative velocity equation for this situation is

$$
\overrightarrow{\mathbf{v}}_{T C}=\overrightarrow{\mathbf{v}}_{T G}+\overrightarrow{\mathbf{v}}_{G C}
$$

The velocity of the ground relative to the car is the negative of the car relative to the ground, and

$$
\overrightarrow{\mathbf{v}}_{T C}=\overrightarrow{\mathbf{v}}_{T G}-\overrightarrow{\mathbf{v}}_{C G}
$$

The $x$-component equation

$$
\left(v_{T C}\right)_{x}=\left(v_{T G}\right)_{x}-\left(v_{C G}\right)_{x}=-v_{T G} \sin 35^{\circ}-0=-(85 \mathrm{~km} / \mathrm{hr}) \sin 35^{\circ}=-48.8 \mathrm{~km} / \mathrm{hr}
$$

The $y$-component equation

$$
\begin{aligned}
\left(v_{T C}\right)_{y} & =\left(v_{T G}\right)_{y}-\left(v_{C G}\right)_{y}=v_{T G} \cos 35^{\circ}-v_{C G}=(85 \mathrm{~km} / \mathrm{hr}) \sin 35^{\circ}-(110 \mathrm{~km} / \mathrm{hr}) \\
& =40.4 \mathrm{~km} / \mathrm{hr}
\end{aligned}
$$

The velocity is
$v_{T C}=\sqrt{\left[\left(v_{T C}\right)_{x}\right]^{2}+\left[\left(v_{T C}\right)_{y}\right]^{2}}=\sqrt{[-48.8 \mathrm{~km} / \mathrm{hr}]^{2}+[40.4 \mathrm{~km} / \mathrm{hr}]^{2}}=63 \mathrm{~km} / \mathrm{hr}$
10. If a projectile is shot horizontally, $v_{i y}=0$. All objects thrown horizontally will take the same amount of time to reach the ground. None of these choices will make stone stay in the air any longer.
11. The motion in the $x$ direction gives the initial velocity

$$
\begin{gathered}
\Delta x=v_{i x} \Delta t \\
v_{i x}=\frac{\Delta x}{\Delta t}=\frac{105 \mathrm{~m}}{4.2 \mathrm{~s}}=25 \mathrm{~m} / \mathrm{s} \\
v_{i x}=v_{i} \cos 25^{\circ} \\
v_{i}=\frac{v_{i x}}{\cos 25^{\circ}}=\frac{25.0 \mathrm{~m} / \mathrm{s}}{\cos 25^{\circ}}=27.6 \mathrm{~m} / \mathrm{s}
\end{gathered}
$$

The $x$-component of the velocity is unchanged since $a_{x}=0$. The $y$-component of the velocity is found

$$
\begin{aligned}
v_{f y}-v_{i y} & =a_{y} \Delta t \\
v_{f y} & =v_{i y}-g \Delta t=v_{i} \sin 25^{\circ}-g \Delta t=(27.6 \mathrm{~m} / \mathrm{s}) \sin 25^{\circ}-\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right)(4.2 \mathrm{~s}) \\
& =-29.5 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

The final speed

$$
v_{f}=\sqrt{v_{f x}^{2}+v_{f y}^{2}}=\sqrt{(25.0 \mathrm{~m} / \mathrm{s})^{2}+(-29.5 \mathrm{~m} / \mathrm{s})^{2}}=38.6 \mathrm{~m} / \mathrm{s}
$$

12. The forces act on different systems. The chair starts to move because my force is greater than friction.
13. The free-body diagram is

Newton's second law gives

$$
\begin{aligned}
\sum F_{x} & =m a_{x} \\
F_{P}-F_{W} & =m a \\
a & =\frac{F_{P}-F_{W}}{m}=\frac{600 \mathrm{~N}-200 \mathrm{~N}}{100 \mathrm{~kg}}=4 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

14. The free-body diagram is

The $x$-component

$$
\begin{aligned}
\sum F_{x} & =M a_{x} \\
F_{e x t} \cos 35^{\circ}-f_{k} & =M a
\end{aligned}
$$

The $y$-component

$$
\begin{aligned}
\sum F_{y} & =M a_{y} \\
N+F_{\text {ext }} \sin 35^{\circ}-M g & =0
\end{aligned}
$$

There are three unknowns, $N, F_{e x t}$, and $f_{k}$. We need another equation.

$$
f_{k}=\mu_{k} N
$$

Solve the $x$-component equation for $f_{k}$

$$
f_{k}=F_{e x t} \cos 35^{\circ}-M a
$$

and the $y$-component equation for $N$

$$
N=M g-F_{e x t} \sin 35^{\circ}
$$

Now substitute into the definition of $\mu_{k}$

$$
\begin{aligned}
F_{e x t} \cos 35^{\circ}-M a & =\mu_{k}\left(M g-F_{e x t} \sin 35^{\circ}\right) \\
& =\mu_{k} M g-\mu_{k} F_{e x t} \sin 35^{\circ} \\
F_{e x t} \cos 35^{\circ}+\mu_{k} F_{e x t} \sin 35^{\circ} & =M a+\mu_{k} M g
\end{aligned}
$$

$$
\begin{aligned}
F_{\text {ext }} & =\frac{M\left(a+\mu_{k} g\right)}{\cos 35^{\circ}+\mu_{k} \sin 35^{\circ}} \\
& =\frac{(3 \mathrm{~kg})\left[1 \mathrm{~m} / \mathrm{s}^{2}+(0.4)\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right)\right]}{\cos 35^{\circ}+(0.4) \sin 35^{\circ}} \\
& =14.1 \mathrm{~N}
\end{aligned}
$$

15. The free-body diagram is (assuming the block slides down the incline)

Taking the $x$-axis along the incline

$$
\begin{aligned}
\sum F_{x} & =m a_{x} \\
f-W \sin \theta & =0 \\
f & =W \sin \theta
\end{aligned}
$$

and the $y$-axis perpendicular to the incline

$$
\begin{aligned}
\sum F_{y} & =m a_{y} \\
N-W \cos \theta & =0 \\
N & =W \cos \theta
\end{aligned}
$$

Since the block is sliding, use the coefficient of kinetic friction

$$
\begin{aligned}
f_{k} & =\mu_{k} N \\
W \sin \theta & =\mu_{k} W \cos \theta \\
\tan \theta & =\mu_{k} \\
\theta & =\tan ^{-1} \mu_{k} \\
& =\tan ^{-1}(0.4) \\
& =21.8^{\circ}
\end{aligned}
$$

16. The free-body diagram for the left block is

Again, take the $x$-axis along the incline

$$
\begin{aligned}
\sum F_{x} & =m_{1} a_{x} \\
T-f_{s}-W_{1} \sin \theta & =0 \\
f_{s} & =T-W_{1} \sin \theta
\end{aligned}
$$

Along the $y$-axis,

$$
\begin{aligned}
\sum F_{y} & =m_{1} a_{y} \\
N-W_{1} \cos \theta & =0 \\
N & =W_{1} \cos \theta
\end{aligned}
$$

The free-body diagram for the other block is

Using Newton's second law with this free-body diagram

$$
\begin{aligned}
\sum F_{y} & =m_{2} a_{y} \\
T-W_{2} & =0 \\
T & =W_{2}
\end{aligned}
$$

The three equations are

$$
\begin{aligned}
f_{s} & =T-W_{1} \sin \theta \\
N & =W_{1} \cos \theta \\
T & =W_{2}
\end{aligned}
$$

Plug the last equation into the first

$$
\begin{aligned}
& f_{s}=W_{2}-W_{1} \sin \theta \\
& N=W_{1} \cos \theta
\end{aligned}
$$

The definition of the coefficient of static friction

$$
\begin{gathered}
f_{s} \leq \mu_{s} N \\
W_{2}-W_{1} \sin \theta_{2} \leq \mu_{s} W_{1} \cos \theta
\end{gathered}
$$

Since the blocks have the same mass, $W_{1}=W_{2}$ and they cancel

$$
\begin{aligned}
1-\sin \theta & \leq \mu_{s} \cos \theta \\
\mu_{s} & \geq \frac{1-\sin \theta}{\cos \theta} \\
\mu_{s} & \geq \frac{1-\sin 37^{\circ}}{\cos 37^{\circ}} \\
\mu_{s} & \geq 0.50
\end{aligned}
$$

17. The angular speed is defined as

$$
\begin{aligned}
\omega & =\frac{\Delta \theta}{\Delta t} \\
& =\frac{2 \pi \mathrm{rad}}{1 \text { day }} \times \frac{1 \text { day }}{24 \text { hours }} \times \frac{1 \text { hour }}{60 \text { minutes }} \times \frac{1 \text { minute }}{60 \text { seconds }} \\
& =7.27 \times 10^{-5} \mathrm{rad} / \mathrm{s}
\end{aligned}
$$

18. The free-body diagram is

Earth

Sun

Applying Newton's second law

$$
\begin{aligned}
\sum F_{r} & =M_{E} a_{r} \\
F & =M_{E} \frac{v^{2}}{r}
\end{aligned}
$$

The force is found from Newton's law of gravity

$$
F=\frac{G M_{E} M_{S}}{r^{2}}
$$

The velocity can be found from the time it takes to complete one orbit

$$
\begin{aligned}
v & =\frac{\text { distance }}{\text { time }} \\
& =\frac{2 \pi r}{T} \\
& =\frac{2 \pi\left(1.50 \times 10^{11} \mathrm{~m}\right)}{1 \text { year }} \times \frac{1 \text { year }}{365 \text { days }} \times \frac{1 \text { day }}{24 \text { hours }} \times \frac{1 \text { hour }}{3600 \mathrm{~s}} \\
& =29,900 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

The Sun's mass can be found from Newton's second law

$$
\begin{aligned}
F & =M_{E} \frac{v^{2}}{r} \\
\frac{G M_{E} M_{S}}{r^{2}} & =M_{E} \frac{v^{2}}{r} \\
M_{S} & =\frac{v^{2} r}{G} \\
& =\frac{(29,900 \mathrm{~m} / \mathrm{s})^{2}\left(1.50 \times 10^{11} \mathrm{~m}\right)}{6.67 \times 10^{-11} \mathrm{~N} \cdot \mathrm{~m}^{2} / \mathrm{kg}^{2}} \\
& =2.0 \times 10^{30} \mathrm{~kg}
\end{aligned}
$$

19. After 60 revolutions, the angular speed is $16 \mathrm{rev} / \mathrm{s}$. Convert all to radians

$$
\begin{aligned}
\Delta \theta & =60 \operatorname{rev} \times \frac{2 \pi \mathrm{rad}}{\mathrm{rev}}=120 \pi \mathrm{rad} \\
\omega & =16 \frac{\mathrm{rev}}{\mathrm{~s}} \times \frac{2 \pi \mathrm{rad}}{\mathrm{rev}}=32 \pi \frac{\mathrm{rad}}{\mathrm{~s}}
\end{aligned}
$$

Find the angular acceleration

$$
\begin{aligned}
\omega_{f}^{2}-\omega_{i}^{2} & =2 \alpha \Delta \theta \\
\alpha & =\frac{\omega_{f}{ }^{2}-\omega_{i}^{2}}{2 \Delta \theta}=\frac{(32 \pi \mathrm{rad} / \mathrm{s})^{2}-(0)^{2}}{2(120 \pi \mathrm{rad} / \mathrm{s})}=13.4 \mathrm{rad} / \mathrm{s}^{2}
\end{aligned}
$$

The time is found

$$
\begin{aligned}
\Delta \theta & =\omega_{i} \Delta t+\frac{1}{2} \alpha(\Delta t)^{2} \\
& =0+\frac{1}{2} \alpha(\Delta t)^{2} \\
\Delta t & =\sqrt{\frac{2 \Delta \theta}{\alpha}}=\sqrt{\frac{2(68.2 \mathrm{rev})}{13.4 \mathrm{rad} / \mathrm{s}^{2}} \times \frac{2 \pi \mathrm{rad}}{\mathrm{rev}}}=8.0 \mathrm{~s}
\end{aligned}
$$

20. The radial acceleration is

$$
a_{r}=\frac{v^{2}}{r}=\frac{(0.5 \mathrm{~m} / \mathrm{s})^{2}}{0.3 \mathrm{~m}}=0.833 \mathrm{~m} / \mathrm{s}^{2}
$$

The tangential acceleration is

$$
a_{t}=\alpha r=\left(2.5 \mathrm{rad} / \mathrm{s}^{2}\right)(0.3 \mathrm{~m})=0.750 \mathrm{~m} / \mathrm{s}^{2}
$$

The net acceleration is

$$
a=\sqrt{a_{r}^{2}+a_{t}^{2}}=\sqrt{\left(0.833 \mathrm{~m} / \mathrm{s}^{2}\right)^{2}+\left(0.750 \mathrm{~m} / \mathrm{s}^{2}\right)^{2}}=1.12 \mathrm{~m} / \mathrm{s}^{2}
$$
