## Refrigeration Methods for Very Low Temperatures

## Evaporative Cooling

Latent heat (also known as enthalpy change of vaporization)

Change in energy as system particle goes from liquid state to vapor state

$$p^* \text{ is the vapor pressure} \quad \ln p_v = -\frac{\Delta H_v}{RT} + B$$

$\Delta H$  is the heat of vaporization (kJ/mole)

$R$  is the gas constant

$T$  is the temperature (Kelvin)

$B$  depends on the substance

- Responsible for cooling by sweating
- Building AC
- Power Plant Cooling

Sprinklers

## Energy Distribution of Atoms in Equilibrium at Two Temperatures

Fig. 2. Evaporative cooling. The graph shows the distributions of the kinetic energies of atoms at an initial temperature  $T_0$  and at a lower temperature  $T_1$ . After the removal from the distribution at  $T_0$  of all atoms with energies above  $E_c$ , collisions among the atoms cause the gas to rethermalize to the lower temperature  $T_1$ .

## Evaporation Cryostat-Principle of Operation

## Evaporation Cryostats

<sup>4</sup>He

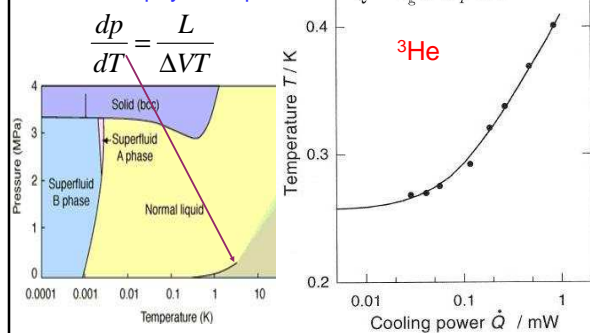

## Pumping on Bulk Liquid

Capable of reaching temperatures of about 300mK in <sup>3</sup>He and approx 1K in <sup>4</sup>He  
Main disadvantage is that the amount of liquid <sup>4</sup>He is reduced by close to 50% to reach 1 Kelvin  
Used in cascade to reach lower temperatures

## Evaporation Cryostats-Cooling Power

Clausius-Clapeyron Equation

$$\ln p_v = -\frac{\Delta H_v}{RT} + B \longrightarrow p_v = p_0 e^{-\frac{\Delta H_v}{RT}}$$

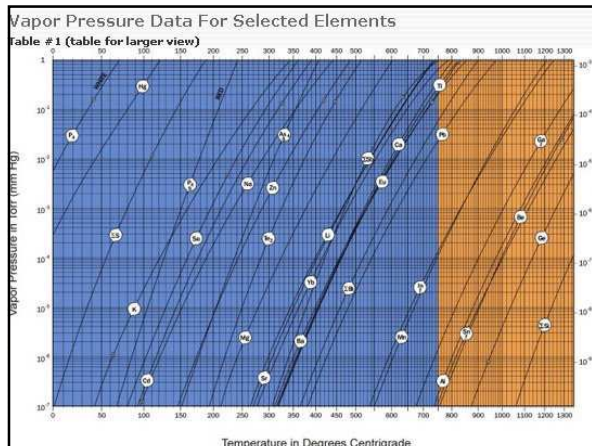

Minus sign in exponential implies lowering p leads to lowering T—many ways to accomplish this

- Bulk liquid: Pumping the vapor away from above the liquid, induces more liquid to vaporize, thus cooling the liquid

Mechanical - Adsorption - Turbo molecular - Diffusion pumps

o BECs: Remove atoms from magnetic trap using rf field

### Osmotic Pressure of $\text{He}^3$ in Liquid $\text{He}^4$ , with Proposals for a Refrigerator to Work below 1°K

H. LONDON AND G. R. CLARKE  
Atomic Energy Research Establishment, Harwell, England

AND

ERIC MENDELSON  
Physical Laboratories, University of Manchester, Manchester, England  
(Received September 21, 1961; revised manuscript received May 14, 1962)

An experimental study has been carried out of the osmotic pressure of solutions of the isotope  $\text{He}^3$  in liquid  $\text{He}^4$  at low temperatures, between 0.8 and 1.2°K. A superleak, a tube packed with a fine powder, acted as a semipermeable membrane which allowed only the superfluid  $\text{He}^3$  to pass. The conclusion from these experiments was that the measured osmotic pressures were in reasonable agreement with values expected from the thermodynamic relations with other equilibrium properties of the mixtures, notably their vapor pressures. Thermodynamic equilibrium therefore seemed to have been attained under the conditions of the experiments. The second half of this paper concerns a study of the cooling which must take place during the adiabatic dilution of  $\text{He}^3$  by  $\text{He}^4$ . If the dilution is carried out at low temperatures where the solutions separate into two phases, the absorption of heat is estimated to be usefully large. After dilution the solution can be distilled, condensed and recirculated so as to make a continuously acting refrigerator. It should be possible to operate at temperatures of 0.1°K or below.

## Where is the Cooling Power?

Define:

Enthalpy (pure  $^3\text{He}$ ) =  $H_3$

Enthalpy (dilute phase) =  $H_D$

Circulation rate of  $^3\text{He}$  =  $\dot{n}$

What is the cooling power of an ideal dilution refrigerator?

A.  $\dot{n}$  B.  $\dot{n} H_3$  C.  $\dot{n} H_D$

D.  $\dot{n} (H_3 - H_D)$  E.  $\dot{n} (H_D - H_3)$

$$\dot{Q} = 82 \dot{n} T_m^2 \text{ watts}$$

## Dilution Refrigeration Development

1965--Das, DeBruyn, & Taconis (Leiden)

$T = 220 \text{ mK}$

--Hall et al (England)  $T \sim 50$

1966--Neganov (Russia)  $T \sim 50 \text{ mK}$

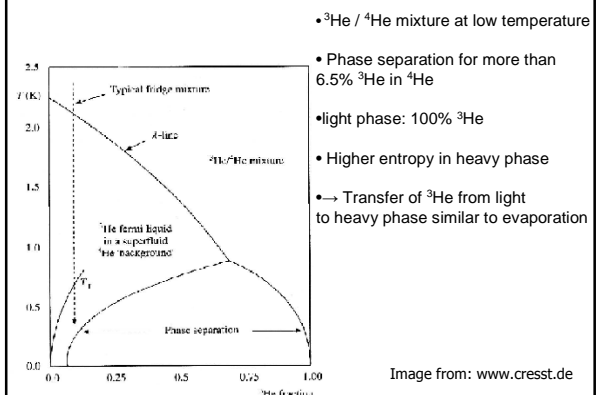

1998--Lowest recorded temperature by dilution refrigeration is 1.7 mK (Cousins et al-Lancaster).

Can have enormous cooling power :  $1 \mu\text{W}$  at 10 mK

Can cool tons of matter-CERN

Can cool quickly-- few hours from room temperature

Kapitza Resistance  $R_K \sim T^{-3}$

The diagram illustrates a distillation column for separating  $^3\text{He}$  and  $^4\text{He}$ . The column is divided into several sections:

- Still:** The top section where the feed enters. It shows a liquid phase (dotted) and a vapor phase (dashed).
- Heat exchanger:** A section with multiple vertical tubes. Red arrows indicate the flow of heat from the liquid phase to the vapor phase.
- Mixing chamber:** A section where the liquid and vapor phases are mixed. It shows a liquid phase (dotted) and a vapor phase (dashed).
- Phase boundary:** A horizontal line separating the liquid and vapor phases.
- Labels:**
  - To  $^4\text{He}$  pump
  - $^3\text{He}$  input
  - Condenser
  - To  $^4\text{He}$  pot
  - Orifice
  - $^3\text{He}$  vapour
  - Dilute phase
  - Heat exchanger
  - Still
  - Tubular heat exchanger
  - Main heat exchanger
  - $^3\text{He}$  liquid
  - Mixing chamber
  - Dilute phase
  - Phase boundary

The top diagram, labeled 'Continuous Heat Exchanger', shows a coiled tube. The inner tube is labeled '0.5/0.3 mm (1 m), Cu-Ni'. The outer tube is labeled '2.0/1.4 mm (2 m) Brass'. Arrows indicate the flow of 'Concentrated phase' and 'Dilute phase'.

The bottom diagram, labeled 'Step Heat Exchanger', shows a cross-section of a semi-circular structure. It features a 'Concentrated  $^3\text{He}$ ' region at the top, a 'Dilute  $^3\text{He}$ ' region at the bottom, and a 'Cu-Ni foil' layer. The structure is supported by 'Silver plated Cu-Ni foil' and 'Sintered silver' at the base, with 'Weld' points indicated.

## Where is the Cooling Power?

Define:

Enthalpy (pure  $^3\text{He}$ ) =  $H_3$  < Enthalpy (dilute phase) =  $H_D$

Circulation rate of  $^3\text{He}$  =  $\dot{n}$

What is the cooling power of an ideal dilution refrigerator?

- A.  $\dot{n}$       B.  $\dot{n} H_3$       C.  $\dot{n} H_D$   
 D.  $\dot{n} (H_3 - H_D)$       E.  $\dot{n} (H_D - H_3)$

$$\dot{Q} = 82 \dot{n} T_m^2 \text{ watts}$$

## Evaporation Vs. Dilution Power

Curves are for the same  
 $^3\text{He}$  Circulation rate

QUIZ: What is the approximate proportion between  $H_D$  and  $H_3$  at 0.35 K?

- A.  $H_D = H_3$   
 B.  $H_D = 0.5 H_3$   
 C.  $H_D = 2 H_3$

## Pomeranchuk Cooling

- Principle of Operation
- Technical Realization
- Cooling Power

## Pomeranchuk Cooling-Principle of Operation

Phase diagram of  $^3\text{He}$

$dp/dT < 0$  for  $T < 0.3\text{K}$

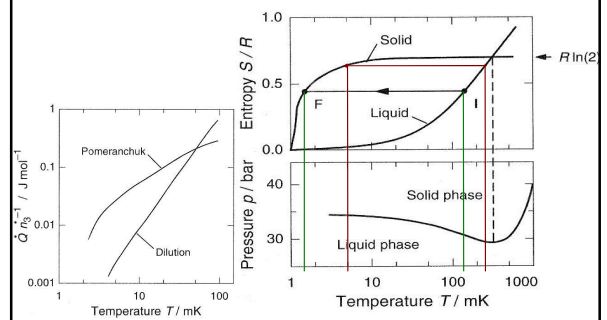

- Entropy of solid  $^3\text{He}$  is higher than that of liquid  $^3\text{He}$
- Heat of solidification is negative

→ Solidifying by applying pressure adiabatically leads to reduced temperature
