Outline

- Unconventional superconductivity
- STM
- Quasiparticle interference
- Bogoliubov-de Gennes + Wannier method
- Applications
 - 1. Zn impurity in BSCCO
 - 2. QPI in BSCCO
- QPI as a qualitative tool

How can two electrons attract each other?

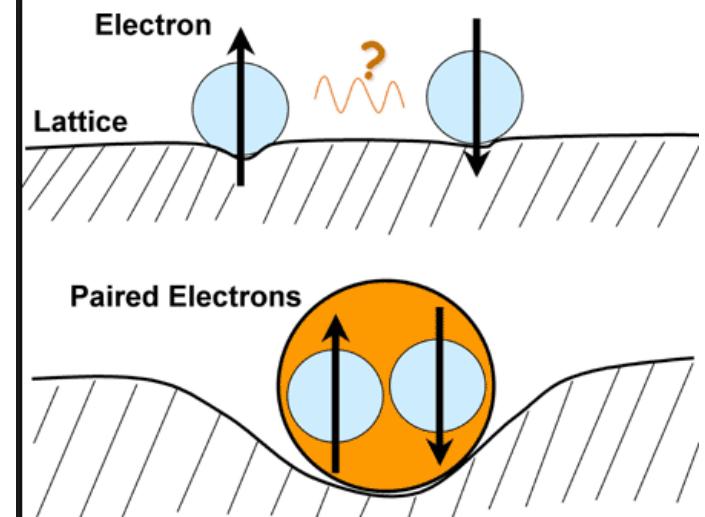

Dance analogy: coherent pairs

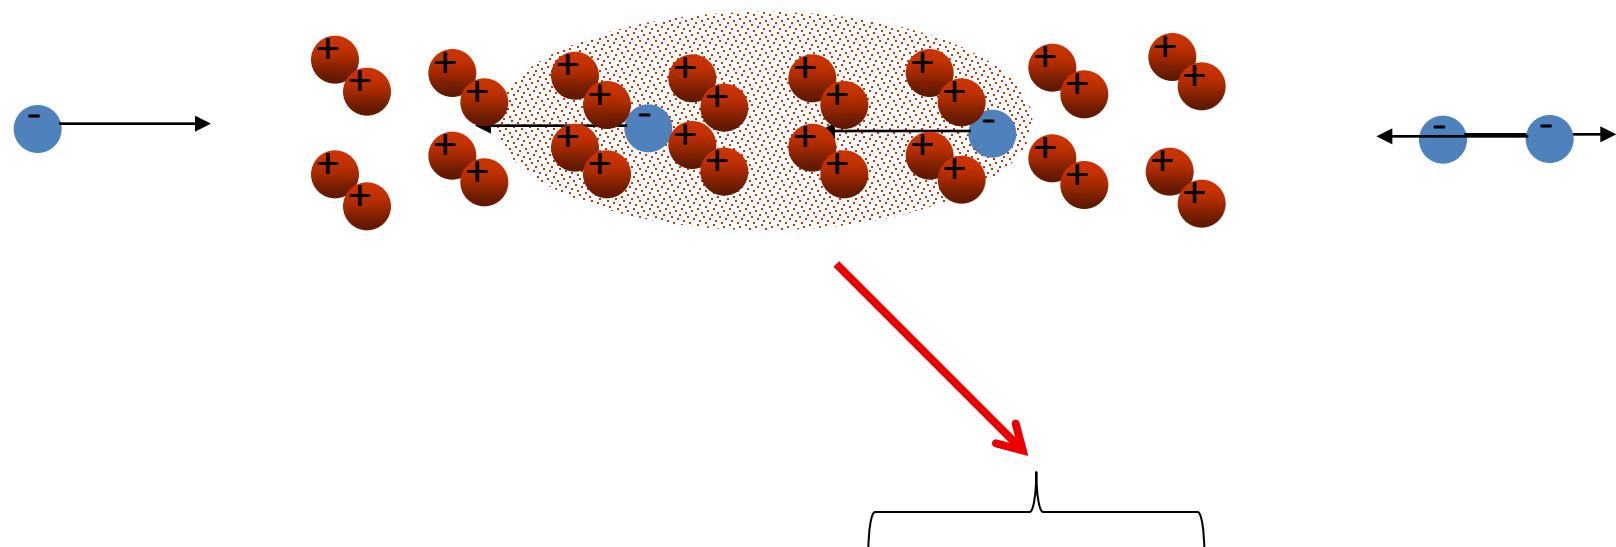

Another analogy:

J. Robert Schrieffer:
“By dancing they lower their
energy or make themselves
happier”

How Cooper pairs form in conventional superconductors the “glue”: electron-phonon interaction

Effective “residual”
e-e interaction
including Coulomb
(“Jellium model”)

$$V(\mathbf{q}, \omega) = \frac{\mathbf{a} 4\pi e^2}{q^2 + k_s^2} + \frac{\mathbf{b} 4\pi e^2}{q^2 + k_s^2} \frac{\omega_q^2}{\omega^2 - \omega_q^2}$$

Screened Coulomb Electron-phonon (attraction)

Realistic system:
 $\mathbf{a} \neq \mathbf{b}$! Depends on
details

Note: electrons avoid Coulomb repulsion in *time* (interaction is *retarded*)

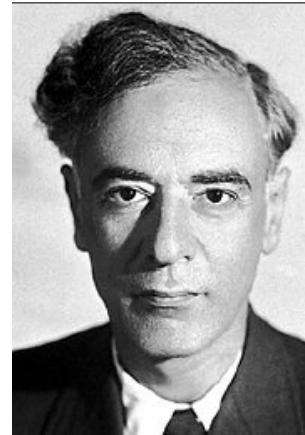

Attraction from repulsion: Kohn-Luttinger 1965

Walter Kohn

Quinn Luttinger

Also: Landau and Pitaevskii

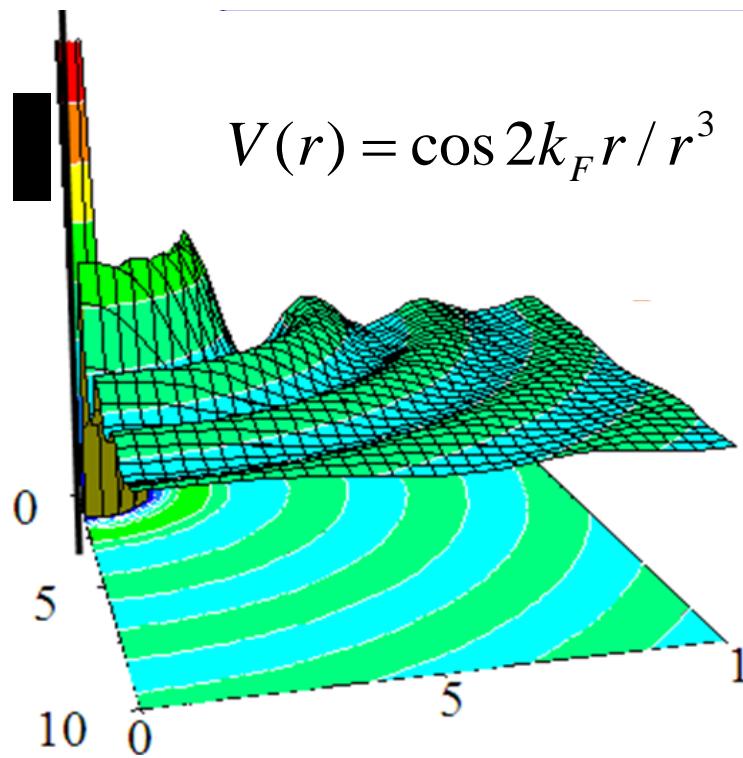

KL: an electron gas with no phonons and only repulsive Coulomb interactions can be a superconductor!

A new paradigm: electrons avoid repulsive part of Coulomb interaction in space rather than time!

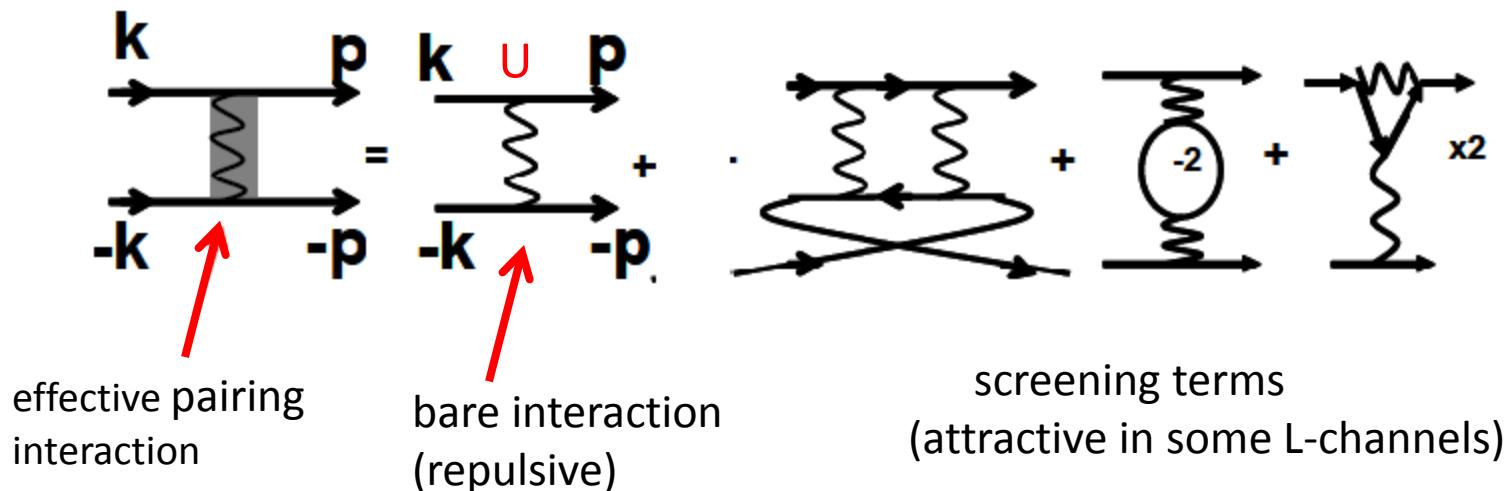

Kohn-Luttinger 1965

Friedel: screened Coulomb interaction

At finite distances, screened Coulomb interaction becomes attractive:
finite-L pairing

Kohn-Luttinger 1965

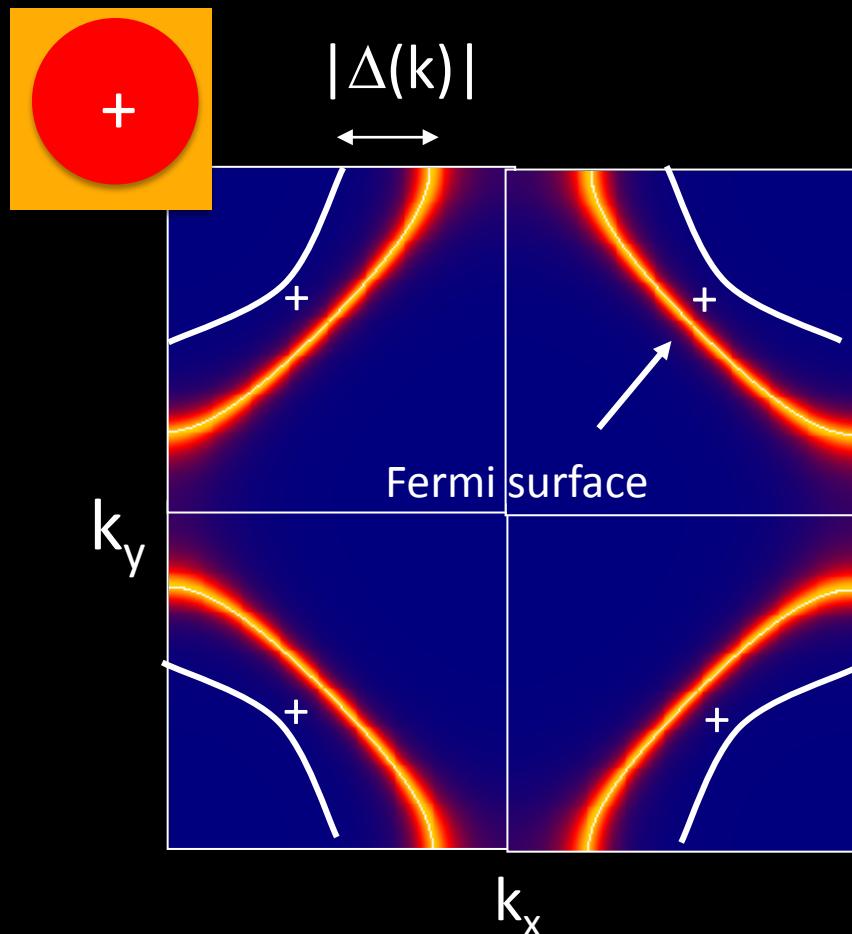

Example: short range $U > 0$ for rotationally invariant system ($\approx {}^3\text{He}$)

$$T_c \approx E_F \exp(-2.5L^4)$$

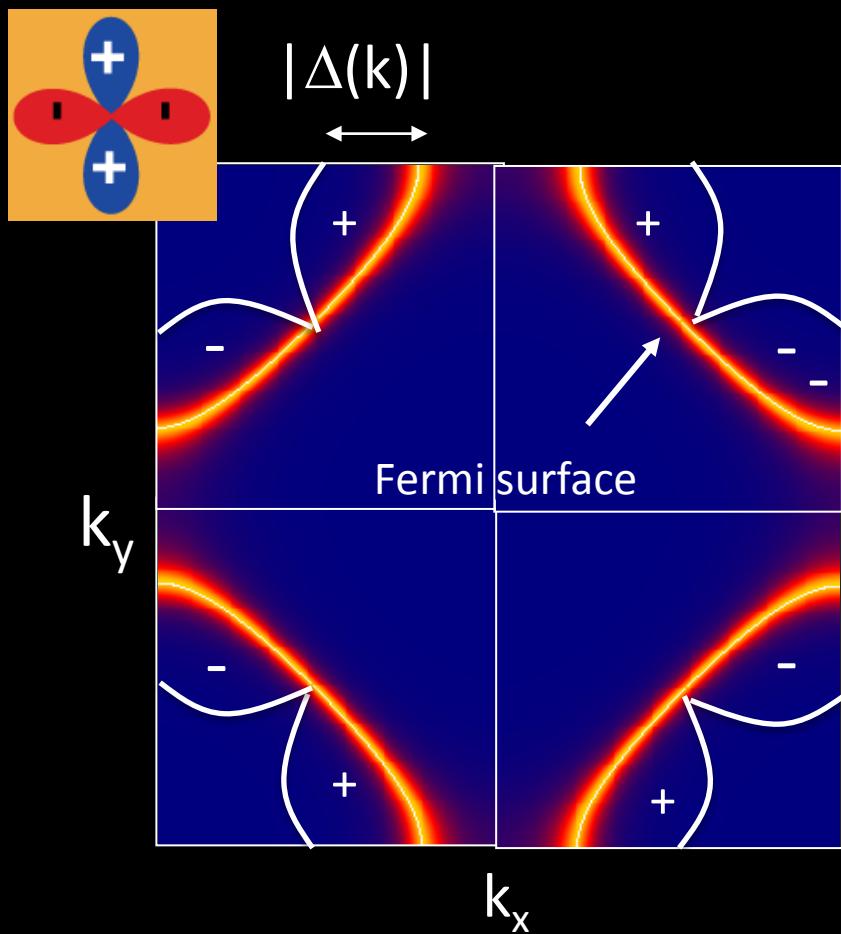

Best calculation in 1965: Brueckner Soda Anderson Morel PR 1960 :
predicted $L=2$ for ${}^3\text{He} \Rightarrow T_c \sim 10^{-17}\text{K}$

But had they taken $L=1$ they would have gotten $T_c \sim 1 \text{ mK!}$

Higher – L pair wavefunctions translated into crystalline environment: Symmetry of order parameter $\Delta(\mathbf{k})$ in 1-band superconductor

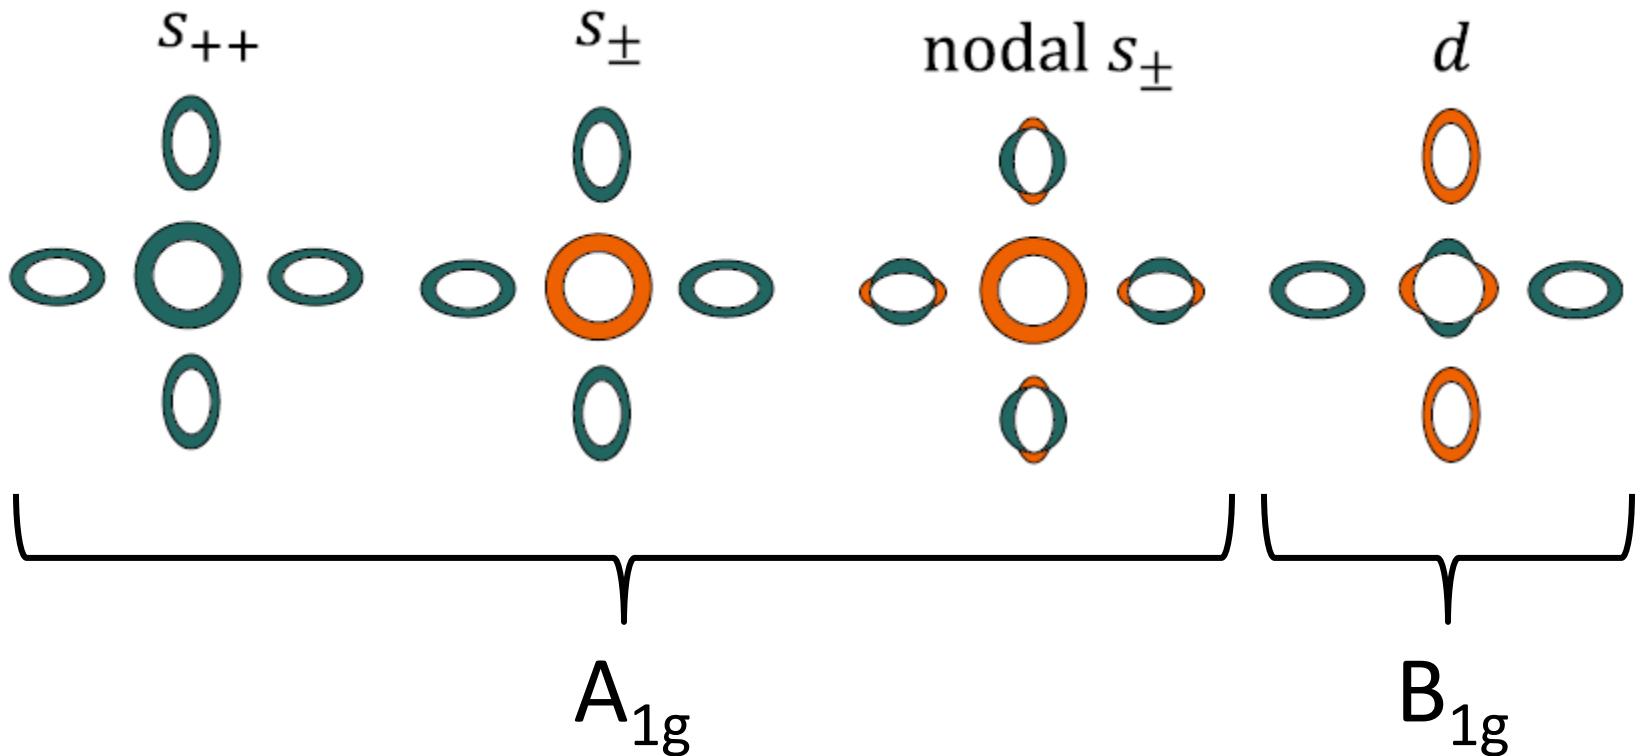

“s-wave, $L=0$ ” no nodes
conventional pair state

“d-wave, $L=2$ ” nodes
unconventional pair state

Gap symmetry vs. structure: Important clue to pairing mechanism!

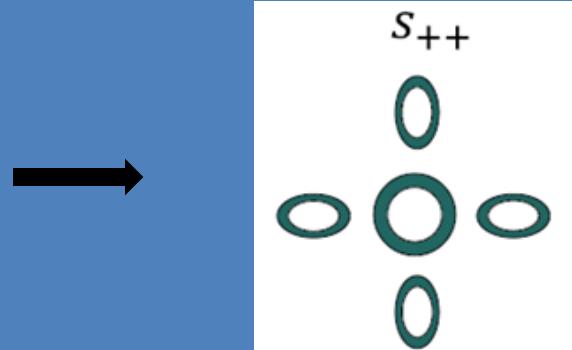

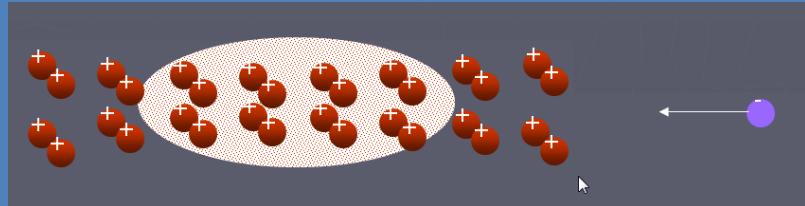

Fe-based superconductors

2 paradigms for superconductivity

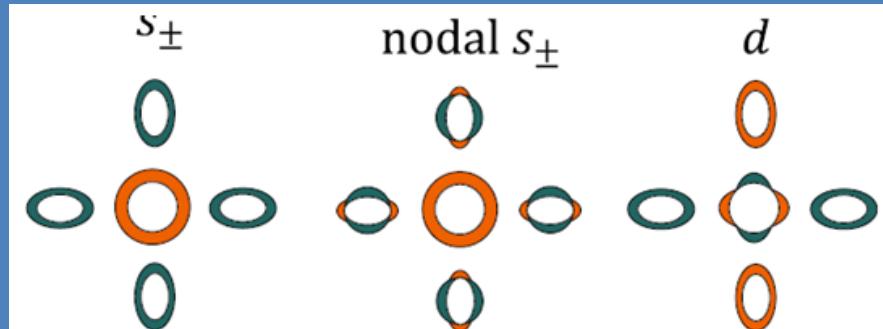

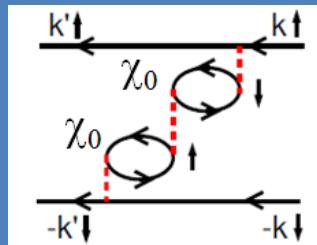

according to how pairs choose to avoid Coulomb interaction

“conventional”: isotropic s-wave pair wave fctn, interaction retarded in time

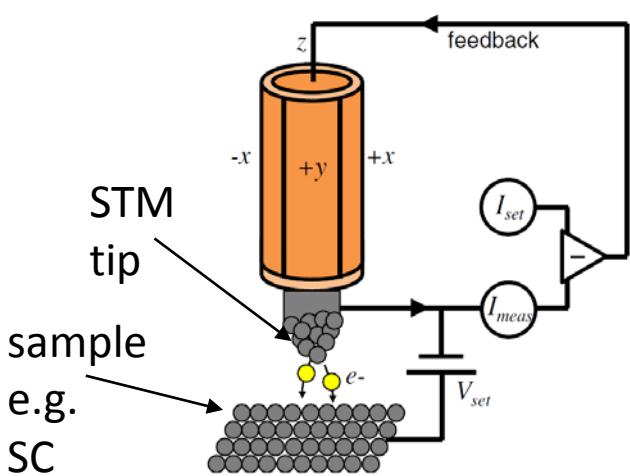

Overall effective interaction *attractive*

“unconventional”: anisotropic or sign-changing pair wave fctn,

Overall effective interaction *repulsive*

$$\rho(\mathbf{q}, \omega) = \sum_{L \times L} e^{i\mathbf{q} \cdot \mathbf{r}} \rho(\mathbf{r}, \omega)$$

Quasiparticle interference (“QPI”) experiments

- can use a real space probe (STM) to give info about momentum space electronic structure ε_{nk}
- can probe symmetry and structure of superconducting gap function
- relies on *disorder* to provide a signal!

Anderson's theorem

P. W. Anderson, J.Phys. Chem. Solids 11, 26 (1959)

THEORY OF DIRTY SUPERCONDUCTORS

P. W. ANDERSON

Bell Telephone Laboratories, Murray Hill, New Jersey

(Received 3 March 1959)

Abstract—A B.C.S. type of theory (see BARDEEN, COOPER and SCHREIFFER, *Phys. Rev.* **108**, 1175 (1957)) is sketched for very dirty superconductors, where elastic scattering from physical and chemical impurities is large compared with the energy gap. This theory is based on pairing each one-electron state with its exact time reverse, a generalization of the k up, $-k$ down pairing of the B.C.S. theory which is independent of such scattering. Such a theory has many qualitative and a few quantitative points of agreement with experiment, in particular with specific-heat data, energy-gap measurements, and transition-temperature versus impurity curves. Other types of pairing which have been suggested are not compatible with the existence of dirty superconductors.

In the presence of dirt one can still pair time-reversed members of Kramer's doublet: thermodynamics (T_c , gap, sp. ht., ...) are not affected by nonmagnetic impurities

Balian-Werthamer: p-wave superconductivity

PHYSICAL REVIEW

VOLUME 131, NUMBER 4

Superconductivity with Pairs in a Relative *p* Wave*†

R. BALIAN

Centre d'Etudes Nucléaires de Saclay, Gif-sur-Yvette (S.O.), France

AND

N. R. WERTHAMER

Bell Telephone Laboratories, Murray Hill, New Jersey

(Received 6 March 1963)

These conclusions are not, in general, true for the *p*-wave pair state. Since the interaction between the conduction electrons and an impurity is short ranged, probably localized to the immediate vicinity of the impurity site itself, the perturbation extends only over a distance comparable to the lattice spacing, and as we remarked earlier very large momentum transfers of order $2k_F$ are allowed. In fact, $|\lambda(\mathbf{k}-\mathbf{k}')|^2$ is certainly not such as to restrict $\hat{\mathbf{k}}$ to the vicinity of $\hat{\mathbf{k}}'$ in Eq. (70).

The exact cancellation of the two last terms, therefore, occurs only for $\gamma=1$, that is for an *s*-wave state with nonmagnetic impurities. The prediction for the *p*-wave pair state, then, is that magnetic impurities would tend to depress the transition temperature to roughly the same degree as for the BCS state, and that in an equivalent concentration nonmagnetic impurities would lower T_c even more, since λ^2 is likely to be a good deal larger in this case.

Nonmagnetic impurities are
pairbreaking in unconventional
superconductors

Strong magnetic impurity creates bound state in s-wave SC

BOUND STATE IN SUPERCONDUCTORS WITH PARAMAGNETIC IMPURITIES

Yu LUH

ABSTRACT

A generalized canonical transformation and a SCF method have been used to investigate the influence of isolated impurity atoms on the properties of superconductors. It has been found that a bound state of excitation exists around a paramagnetic impurity with its energy level in the energy gap. An analytical expression has been obtained for the corresponding wave function. The effect of electromagnetic absorption due to the bound state should appear as a precursory peak. The possible experimental verifications of the bound state through tunnelling effect and infrared absorption are discussed.

Furthermore, the excitations of continuous spectra around a nonmagnetic impurity and the spatial variation of the energy gap parameter have been considered.

Impurity States and Interlayer Tunneling in High Temperature Superconductors

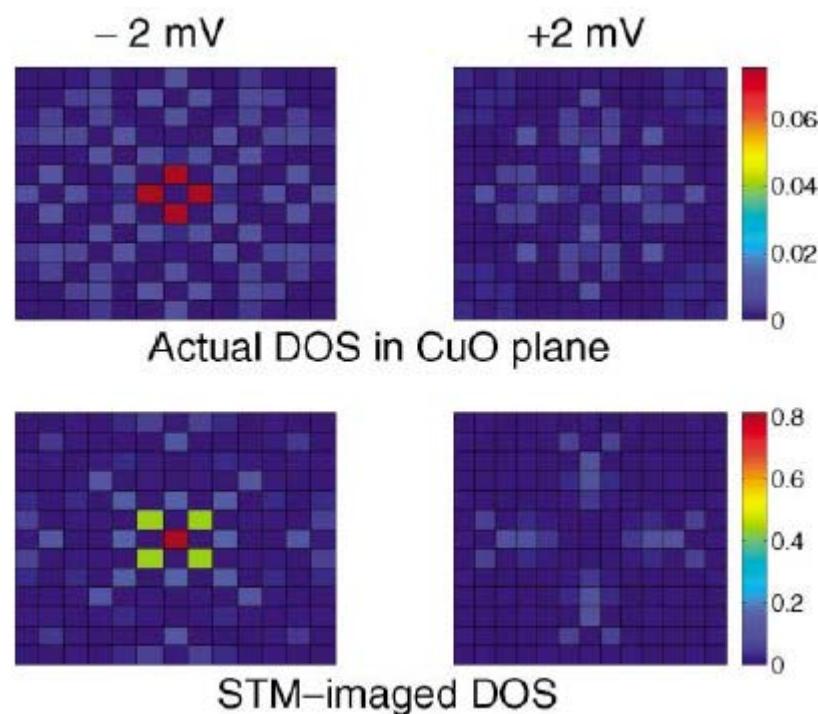

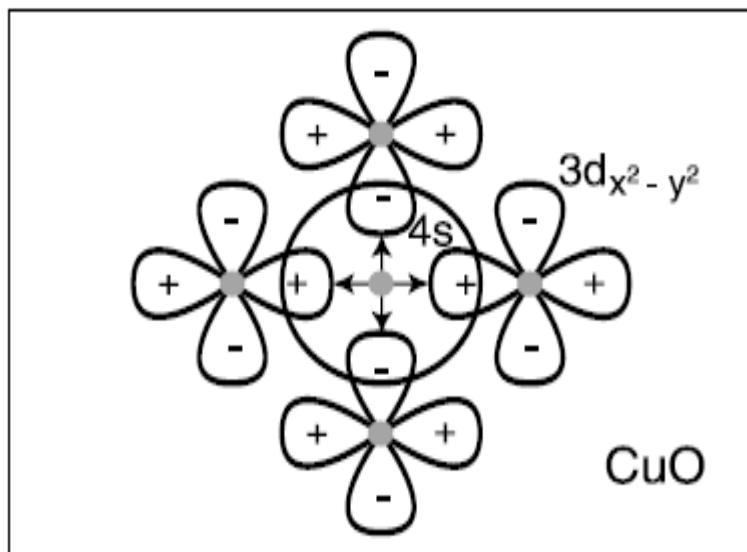

I. Martin,¹ A. V. Balatsky,¹ and J. Zaanen²

¹Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545

²Leiden Institute of Physics, Leiden University, 2333CA Leiden, The Netherlands

(Received 22 December 2000; published 15 February 2002)

"Tunneling involves orbitals that extend out of the planes, such as 4s Cu. These orbitals are symmetric in the Cu-O plane and hence couple to the neighboring metal 3d_{x²-y²} orbitals through the d-wave-like fork"

Bogoliubov-de Gennes (BdG) equations for Cu lattice

$$H_{MF} = \sum_{ij\mu\nu\sigma} t_{ij}^{\mu\nu} c_{i\mu\sigma}^\dagger c_{j\nu\sigma} - \mu_0 \sum_{i\mu\sigma} c_{i\mu\sigma}^\dagger c_{i\mu\sigma} - \sum_{ij\mu\nu} \left[\Delta_{ij}^{\mu\nu} c_{i\mu\uparrow}^\dagger c_{j\nu\downarrow}^\dagger + h.c. \right] + \sum_{i^*\mu\sigma} V_{imp}^{\mu\nu} c_{i^*\mu\sigma}^\dagger c_{i^*\nu\sigma}$$

$$\Delta_{ij}^{\mu\nu} = V_{ij}^{\mu\nu} \langle c_{j\nu\downarrow} c_{i\mu\uparrow} \rangle$$

Applying Bogoliubov transformation leads to BdG equations

$$\sum_{j\nu} \begin{pmatrix} t_{ij}^{\mu\nu} - \mu_0 \delta_{ij} \delta_{\mu\nu} & -\Delta_{ij}^{\mu\nu} \\ -\Delta_{ji}^{\nu\mu*} & -t_{ij}^{\mu\nu} + \mu_0 \delta_{ij} \delta_{\mu\nu} \end{pmatrix} \begin{pmatrix} u_{j\nu}^n \\ v_{j\nu}^n \end{pmatrix} = E_n \begin{pmatrix} u_{i\mu}^n \\ v_{i\mu}^n \end{pmatrix}$$

$$n_{i\mu\uparrow} = \sum_n |u_{i\mu}^n|^2 f(E_n) \quad n_{i\mu\downarrow} = \sum_n |v_{i\mu}^n|^2 (1 - f(E_n))$$

$$\Delta_{ij}^{\mu\nu} = V_{ij}^{\mu\nu} \sum_n u_{i\mu}^n v_{j\nu}^* f(E_n)$$

u, v and E_n are obtained by solving BdG equations self-consistently for a given filling.

Local Density of States

Lattice Green's function and Lattice LDOS

$$G_{ij}^{\mu\nu}(\omega) = \sum_{n\sigma} \left[\frac{u_{i\mu}^n u_{j\nu}^*}{\omega - E_n + i\eta} + \frac{v_{i\mu}^n v_{j\nu}^*}{\omega + E_n + i\eta} \right]$$

$$n_{i\mu}(\omega) = -\frac{1}{\pi} \text{Im} [G_{ii}^{\mu\mu}(\omega)]$$

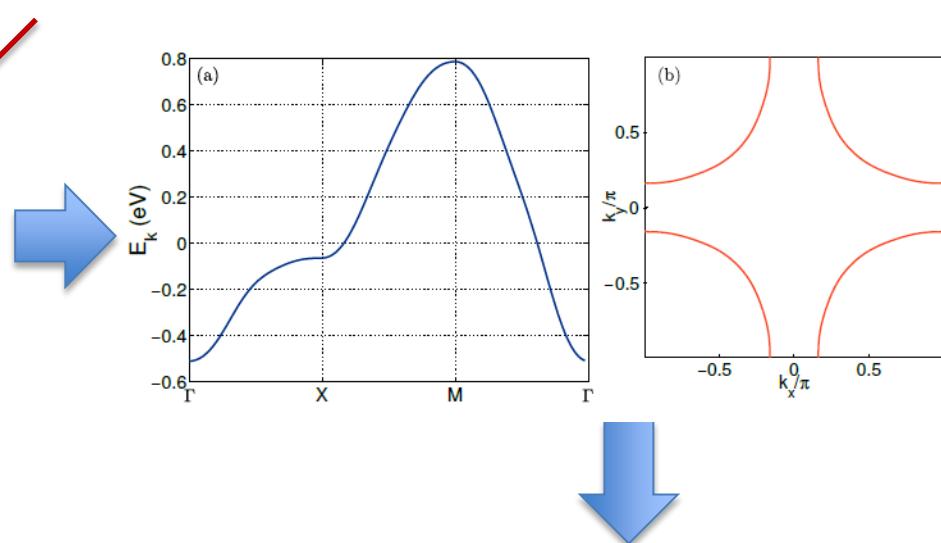

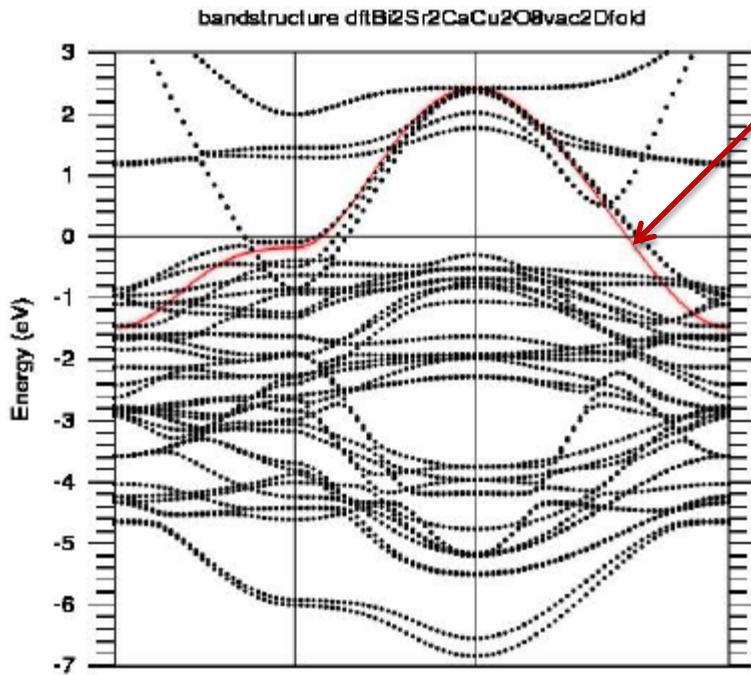

Local continuum Green's function and LDOS

$$G(\mathbf{r}, \mathbf{r}', \omega) = \sum_{ij\mu\nu} w_{i\mu}(\mathbf{r}) G_{ij}^{\mu\nu}(\omega) w_{j\nu}(\mathbf{r}')^*$$

$$w_{\mathbf{R}}(\mathbf{r}) = \frac{1}{\sqrt{N}} \sum_{\mathbf{k}} \psi_k(\mathbf{r}) e^{-i\mathbf{k}\cdot\mathbf{R}} \quad (\text{Wannier function for one band system})$$

$$A(\mathbf{r}, \omega) = -\frac{1}{\pi} \text{Im} [G(\mathbf{r}, \mathbf{r}, \omega)]$$

Comparison to experiment

QPI as a model-free phase-sensitive tool in unconventional superconductors

PH, D. Altenfeld, I.I. Mazin, I. Eremin PRB92, 184513 (2015)

1. QPI is not...

- a quantitative tool
- a low-energy (near-Fermi) property
- proportional to coherence factors

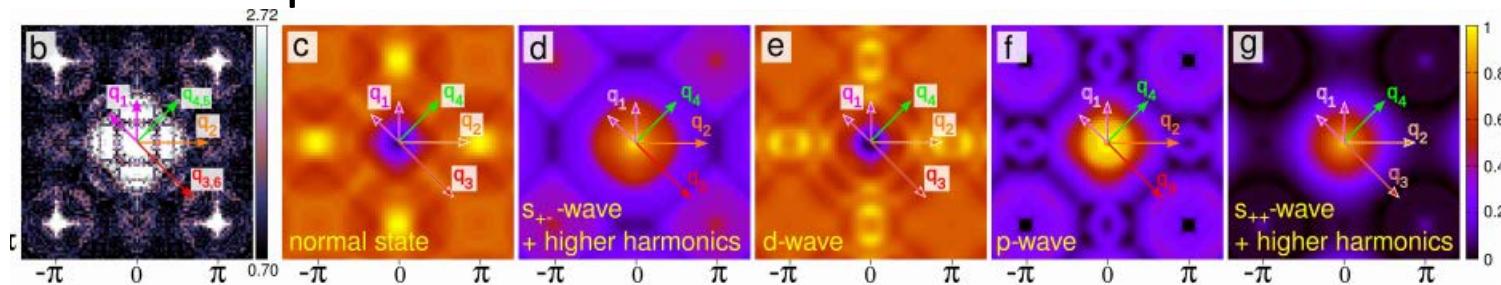

2. But QPI may be

- a qualitative tool, if one can see qualitatively different behavior in different cases of interest (*e.g.*, s_{\pm} vs. s_{++})

1. QPI is *not*

- a quantitative tool

e.g. Hänke et al. PRL 2012

- proportional to coherence factors

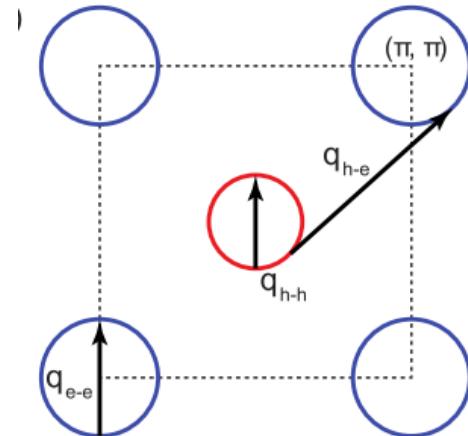

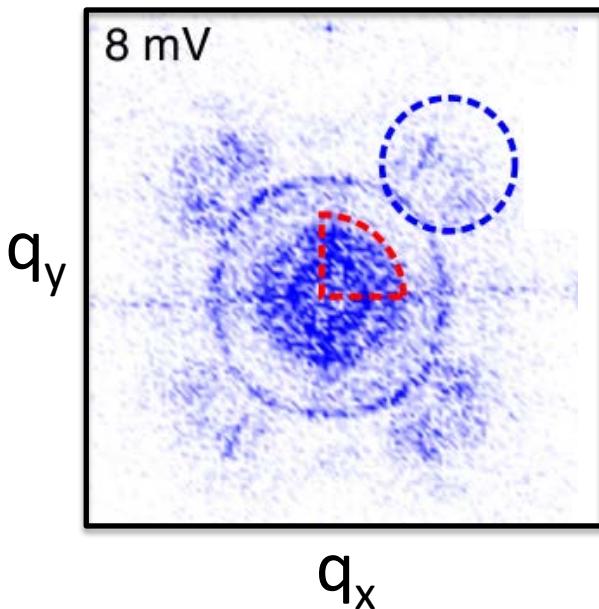

Scatterer	$C(q)$ in $R^{odd}(\mathbf{q}, V)$	Maltseva & Coleman, 2009
Weak scalar	$(\mathbf{u}\mathbf{u}' - \mathbf{v}\mathbf{v}')^2$

Resonant	$(uu' + vv')(uu' - vv')$	
Andreev	$(uu' - vv')(uv' + vu')$	

QPI as a model-free phase-sensitive tool

Chi et al, PRB 2014

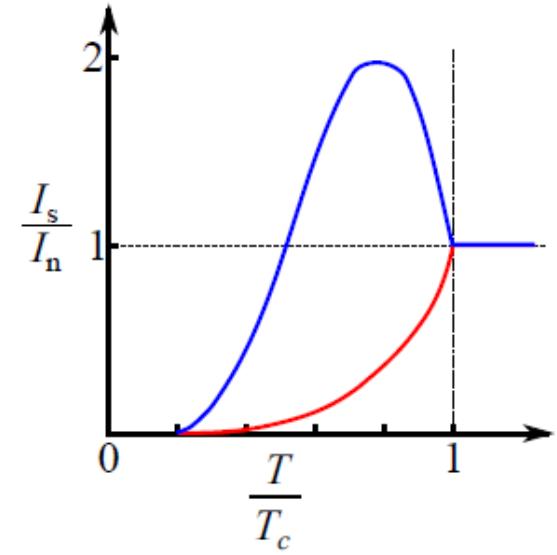

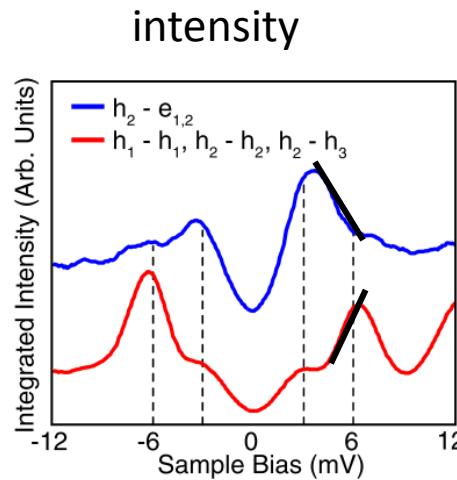

Does superconductivity enhance
the large q transitions and
suppress the small q ones?

LiFeAs

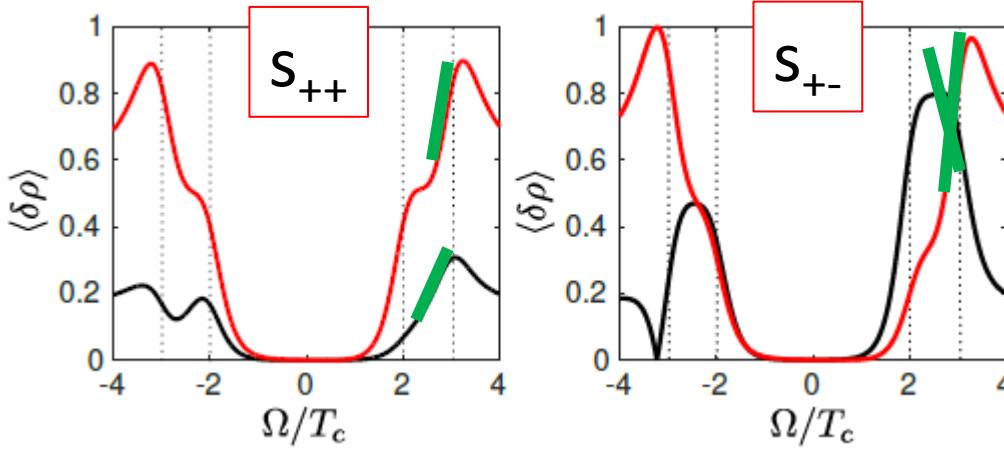

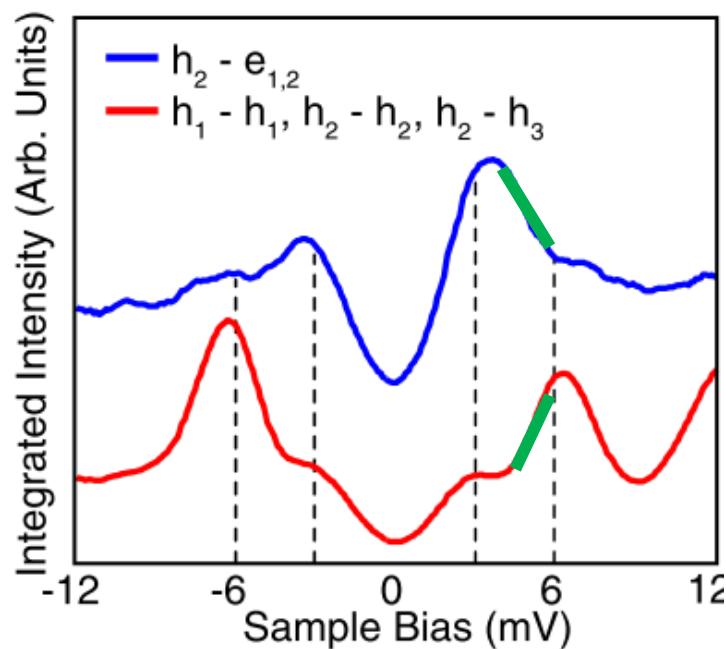

coherence factors?

$$W_{i \rightarrow f}(\mathbf{k}, \mathbf{k}') \propto |u_i(\mathbf{k})u_f^*(\mathbf{k}') \pm v_i(\mathbf{k})v_f^*(\mathbf{k}')|^2 \\ \times |V(\mathbf{k}' - \mathbf{k})|^2 N_i(\mathbf{k})N_f(\mathbf{k}'),$$

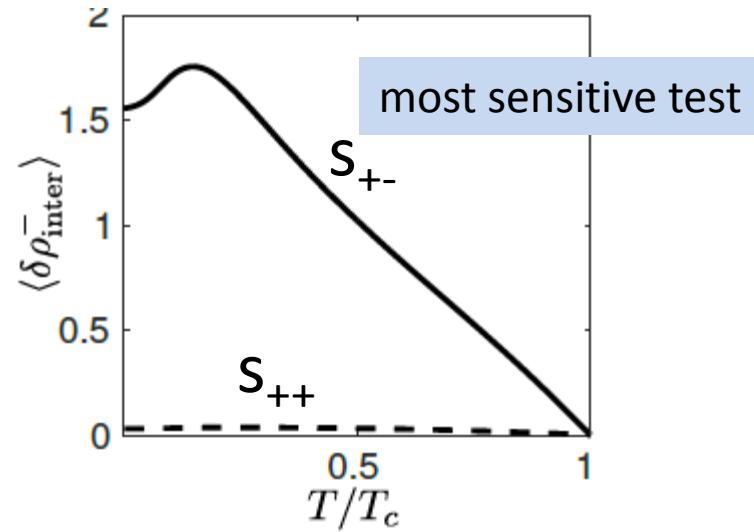

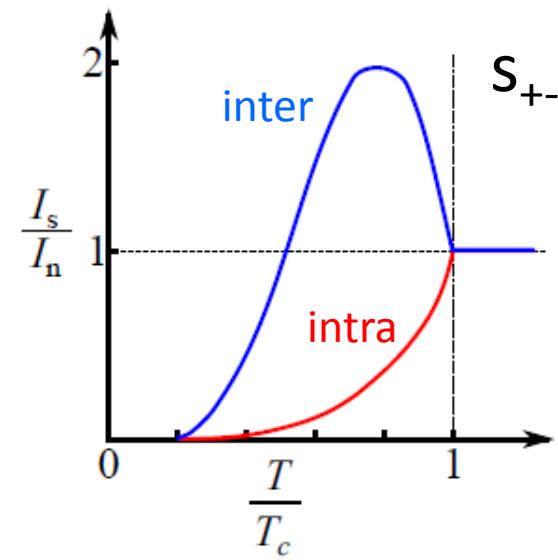

Qualitative probe of gap sign change?

$$W_{i \rightarrow f}(\mathbf{k}, \mathbf{k}') \propto |u_i(\mathbf{k})u_f^*(\mathbf{k}') \pm v_i(\mathbf{k})v_f^*(\mathbf{k}')|^2$$

$$\times |V(\mathbf{k}' - \mathbf{k})|^2 N_i(\mathbf{k})N_f(\mathbf{k}'),$$

Conclusions

1. Simple method of using discarded Wannier function information to calculate local STM conductance in inhomogeneous SC: enhances resolution, preserves local symmetries, allows calculation of true surface properties.
2. Application to BSCCO: resolution of old Zn and Ni paradoxes
Dramatic improvement of QPI calculations
3. Suggestions to determine gap signs: (i) s/c-normal differences and (ii) symmetrized/antisymmetrized combinations are more informative than just QPI. (iii) monitor T-dependence at a given bias

Coherence factors

$$|Z(\mathbf{q}, E)|^2 \propto \left[\frac{2\pi}{\hbar} \int \frac{dE'}{E - E'} \int d\mathbf{k}_1 d\mathbf{k}_2 C(\mathbf{k}_1, \mathbf{k}_2) t_{\mathbf{k}_1, \mathbf{k}_2} \delta(E - E_{\mathbf{k}_1}) \delta(E' - E_{\mathbf{k}_2}) \delta^{(2)}(\mathbf{k}_1 - (\mathbf{k}_2 + \mathbf{q})) \right]^2$$
$$C(\mathbf{k}_i, \mathbf{k}_f) = (u_{\mathbf{k}_i} u_{\mathbf{k}_f} - v_{\mathbf{k}_i} v_{\mathbf{k}_f})^2$$

Hanaguri et al 2008, Maltseva and Coleman 2009

~~✓~~ $W_{i \rightarrow f}(\mathbf{k}, \mathbf{k}') \propto |u_i(\mathbf{k})u_f^*(\mathbf{k}') \pm v_i(\mathbf{k})v_f^*(\mathbf{k}')|^2$
 $\times |V(\mathbf{k}' - \mathbf{k})|^2 N_i(\mathbf{k}) N_f(\mathbf{k}'),$

FTLDOS for single impurity

$$\begin{aligned}\delta\rho(\mathbf{q},\omega) &= \frac{1}{\pi} \text{Im} \sum_{\mathbf{k}} \left[\hat{G}^0(\mathbf{k},\omega) \hat{t}(\omega) \hat{G}^0(\mathbf{k} + \mathbf{q},\omega) \right]_{11} \quad (2) \\ &= \frac{1}{2} \text{Tr} \text{Im} \sum_{\mathbf{k}} (\tau_0 + \tau_3) \hat{G}^0(\mathbf{k},\omega) \hat{t}(\omega) \hat{G}^0(\mathbf{k} + \mathbf{q},\omega).\end{aligned}$$

small q integrated weight:

$$\begin{aligned}\delta\rho_{intra}(\omega) &\quad (4) \\ &= \frac{1}{2} \text{Tr} \text{Im} \sum_{\mathbf{k}, \mathbf{q} \approx 0, \nu} (\tau_0 + \tau_3) \hat{G}_{\nu}^0(\mathbf{k},\omega) \hat{t}_{\nu\nu}(\omega) \hat{G}_{\nu}^0(\mathbf{k} + \mathbf{q},\omega) \\ &\approx \frac{1}{2} \text{Tr} \text{Im} \sum_{\mathbf{k}, \mathbf{q}, \nu} (\tau_0 + \tau_3) \hat{G}_{\nu}^0(\mathbf{k},\omega) \hat{t}_{\nu\nu}(\omega) \hat{G}_{\nu}^0(\mathbf{k} + \mathbf{q},\omega) \\ &= \frac{1}{2} \text{Tr} \text{Im} \sum_{\mathbf{k}, \mathbf{k}', \nu} (\tau_0 + \tau_3) \hat{G}_{\nu}^0(\mathbf{k},\omega) \hat{t}_{\nu\nu}(\omega) \hat{G}_{\nu}^0(\mathbf{k}',\omega),\end{aligned}$$

Independent k sums: use $\sum_{\mathbf{k}} \hat{G}_{\nu}^0(\mathbf{k},\omega) \simeq i\pi\rho_{\nu} \frac{\omega\tau_0 + \Delta_{\nu}\tau_1}{\sqrt{\omega^2 - \Delta_{\nu}^2}}.$

Similarly for interband terms...

Determine Δ sign change by measuring symmetrized and antisymmetrized conductances at large and small q

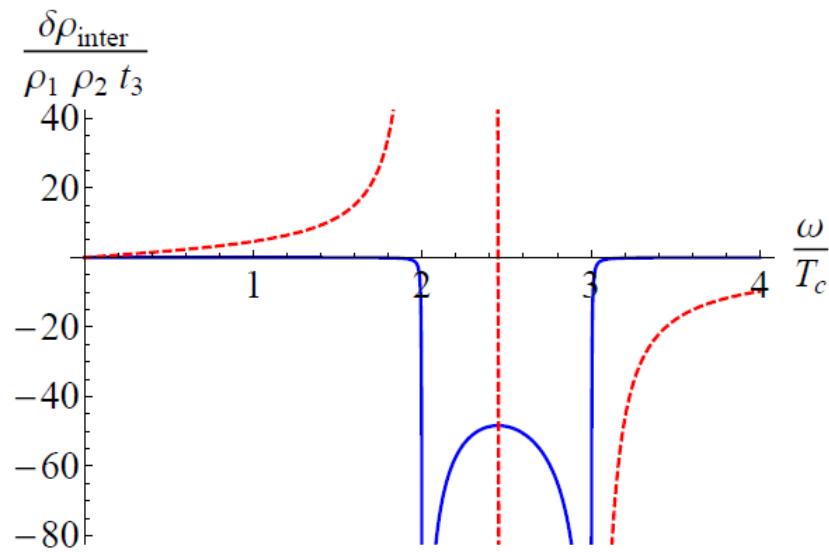

FIG. 1. Interband frequency response $\delta\rho_{\text{inter}}/(t_3\rho_1\rho_2)$ for constant t_3 t -matrix. Gap magnitudes are $|\Delta_1|/T_c = 3$, $|\Delta_2|/T_c = 2$, and artificial broadening $\eta = 10^{-3}$. Blue (solid line): s_{\pm} state; Red(dashed): $s_{++} \times 10^3$.

$$\rho_{\text{inter}}^{(\pm)}(\omega) = \rho_{\text{inter}}^{\text{intra}}(\omega) \pm \rho_{\text{inter}}^{\text{intra}}(-\omega),$$

		<i>intra</i>	<i>inter</i>
s_{++}	$\delta\rho^{(+)}$	✓	✓
	$\delta\rho^{(-)}$	✗	✗
s_{\pm}	$\delta\rho^{(+)}$	✓	✗
	$\delta\rho^{(-)}$	✗	✓

TABLE I. Presence or absence of singular response in the symmetric (+) and antisymmetric (-) channels for s_{++} and s_{\pm} superconductors of the integrated QPI intensity (Fourier transformed density of states). Here ✓ indicates the presence of a strong frequency dependent response in the given channel, and the ✗ indicates the absence of one.

T-dependence as one enters SC state should be most sensitive measure!

Remark on “Hanaguri method”

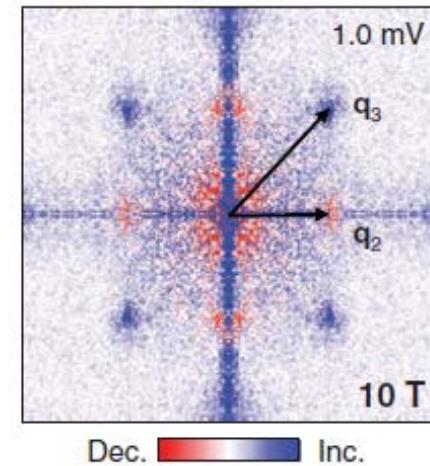

- T. Nunner et al., Phys. Rev. B 73, 104511 (2006): QPI with Andreev “ τ_0 ” pointlike scatterers
- T. Pereg-Barnea and M. Franz, Phys. Rev. B 78, 020509 (2008): proposal to use disordered vortex lattice as source of controlled disorder
- T. Hanaguri et al, Science 323, 923 (2009): BSCCO: sign-changing q-peaks
- M. Maltseva and P. Coleman, PRB 80, 144514 2009: formalism with coherence factors
- T. Hanaguri et al Science 328, 474 (2010): same for Fe(Se,Te)

Pereg-Barnea and Franz 2008

It then follows that

$$\delta n_e(q_{ij}, \omega) \sim \begin{cases} 4\omega^2 \mathcal{K}_{ij}(\omega), & \text{if } \operatorname{sgn} \Delta_i = \operatorname{sgn} \Delta_j \\ 0, & \text{if } \operatorname{sgn} \Delta_i \neq \operatorname{sgn} \Delta_j \end{cases} \quad (15)$$

Thus, remarkably, we find that only those interference peaks will be enhanced by applied magnetic field whose wavevectors q_{ij} connect octet points in the regions of the Brillouin zone with the same sign of the gap function Δ_k , denoted by $+/+$ and $-/-$ in Fig. I(a). These are q_1 , q_4 , and q_5 . The remaining $+/-$ peaks will be to leading order unaffected. The resulting pattern is illustrated in Fig. I(b). We remark that these are precisely the peaks observed to be enhanced in the experiments by Hanaguri et al. [9].

No real theoretical understanding
of why field *suppresses* + q vectors

Emergent defect states: theory 1. SDW state

Gastiasoro, PJH, and Andersen, PRB 2013

$$H = H_0 + H_{int} + H_{imp},$$

$$H_0 = \sum_{\mathbf{ij}, \mu\nu, \sigma} t_{\mathbf{ij}}^{\mu\nu} c_{\mathbf{i}\mu\sigma}^\dagger c_{\mathbf{j}\nu\sigma} - \mu_0 \sum_{\mathbf{i}\mu\sigma} n_{\mathbf{i}\mu\sigma}$$

$$H_{int} = U \sum_{\mathbf{i}, \mu} n_{\mathbf{i}\mu\uparrow} n_{\mathbf{i}\mu\downarrow} + \left(U' - \frac{J}{2} \right) \sum_{\mathbf{i}, \mu < \nu, \sigma\sigma'} n_{\mathbf{i}\mu\sigma} n_{\mathbf{i}\nu\sigma'} \\ (3)$$

$$- 2J \sum_{\mathbf{i}, \mu < \nu} \vec{S}_{\mathbf{i}\mu} \cdot \vec{S}_{\mathbf{i}\nu} + J' \sum_{\mathbf{i}, \mu < \nu, \sigma} c_{\mathbf{i}\mu\sigma}^\dagger c_{\mathbf{i}\mu\bar{\sigma}}^\dagger c_{\mathbf{i}\nu\bar{\sigma}} c_{\mathbf{i}\nu\sigma},$$

$$H_{imp} = V_{imp} \sum_{\mu\sigma} c_{\mathbf{i}^*\mu\sigma}^\dagger c_{\mathbf{i}^*\mu\sigma}$$

$$H_{\mathbf{ij}\sigma}^{\mu\nu} = t_{\mathbf{ij}}^{\mu\nu} + \delta_{\mathbf{ij}} \delta_{\mu\nu} [-\mu_0 + \delta_{\mathbf{ii}^*} V_{imp} + U \langle n_{\mathbf{i}\mu\bar{\sigma}} \rangle]$$

Mean field \Rightarrow

$$+ \sum_{\mu' \neq \mu} (U' \langle n_{\mathbf{i}\mu'\bar{\sigma}} \rangle + (U' - J) \langle n_{\mathbf{i}\mu'\sigma} \rangle)],$$

t-matrix for 1 zero range impurity

$$t_\alpha(\mathbf{q}) = t_\alpha \sum_i e^{i\mathbf{q}\cdot\mathbf{R}_i};$$

$$\Lambda_\alpha(\mathbf{q}) = \sum_{\mathbf{k}} G^0(\mathbf{k}, \omega) \tau_\alpha G^0(\mathbf{k} + \mathbf{q}, \omega)$$

response function

$\alpha=3$: “potential scatt.” $\alpha=0$: “magnetic scatt.”

$\delta\rho$ *still* = (octet peaks) • (noise)

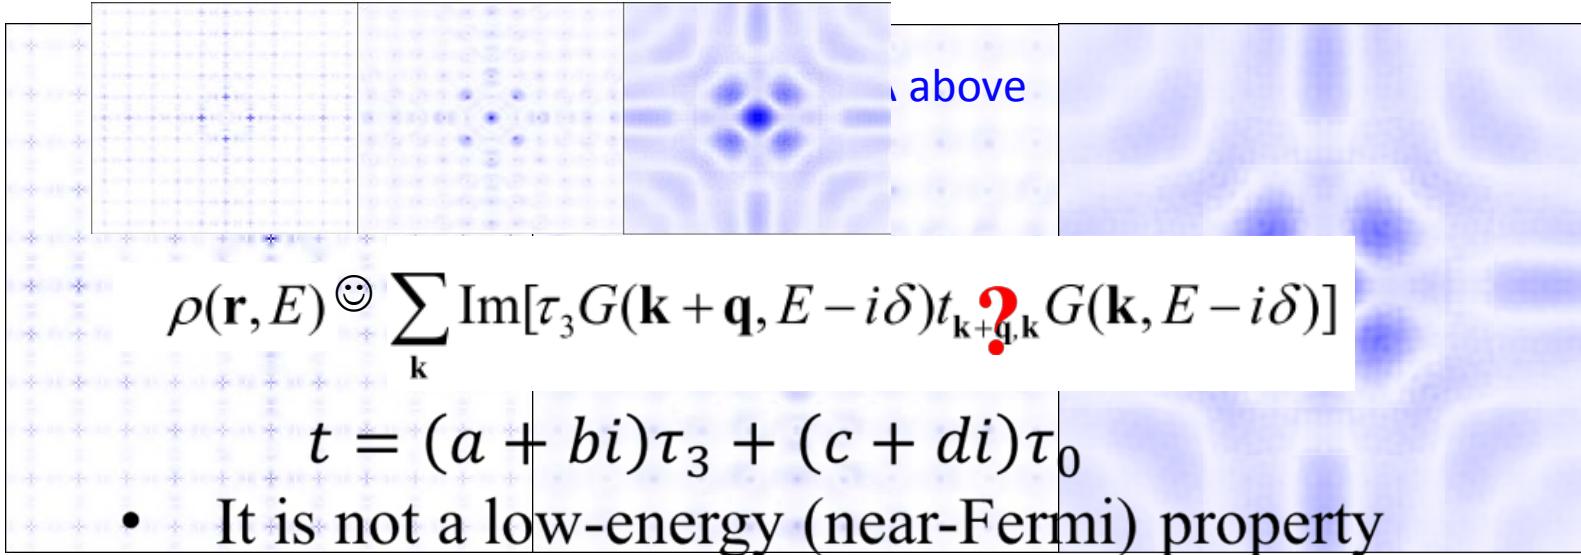

→ No broadening in q-space *unless*
scattering is **not weak** and **not zero range**

Why QPI is not a quantitative tool?

- What is measured?

tunneling conductance $g(\mathbf{r}, E)$, which is related to the local DOS $\rho(\mathbf{r}, E)$.

- related it is...

$$\int \frac{dE'}{E - E'} \int d\mathbf{k}_1 d\mathbf{k}_2 C(\mathbf{k}_1, \mathbf{k}_2) t_{\mathbf{k}_1, \mathbf{k}_2} \delta(E - E_{\mathbf{k}_1}) \delta(E' - E_{\mathbf{k}_2}) \delta^{(2)}(\mathbf{k}_1 - (\mathbf{k}_2 + \mathbf{q}))$$

$E_k^2 \neq E_k E_{k'}$

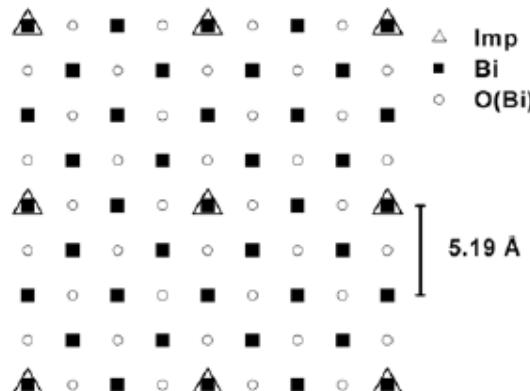

- It is not proportional to

$$Tr \text{Im} \int_k \tau_3 G_k(\omega) \tau_3 G_{k+q}(\omega)$$

$$\int_k (E^2 + \xi_k \xi_{k+q} - \Delta_1 \Delta_2) \text{Im} \frac{1}{E^2 - E_k^2} \text{Re} \frac{1}{E^2 - E_{k+q}^2}$$

Q: How to include SC?

Ni impurity in BSCCO: expt.*

*Hudson *et al.*, Nature 403, 786 (2000)

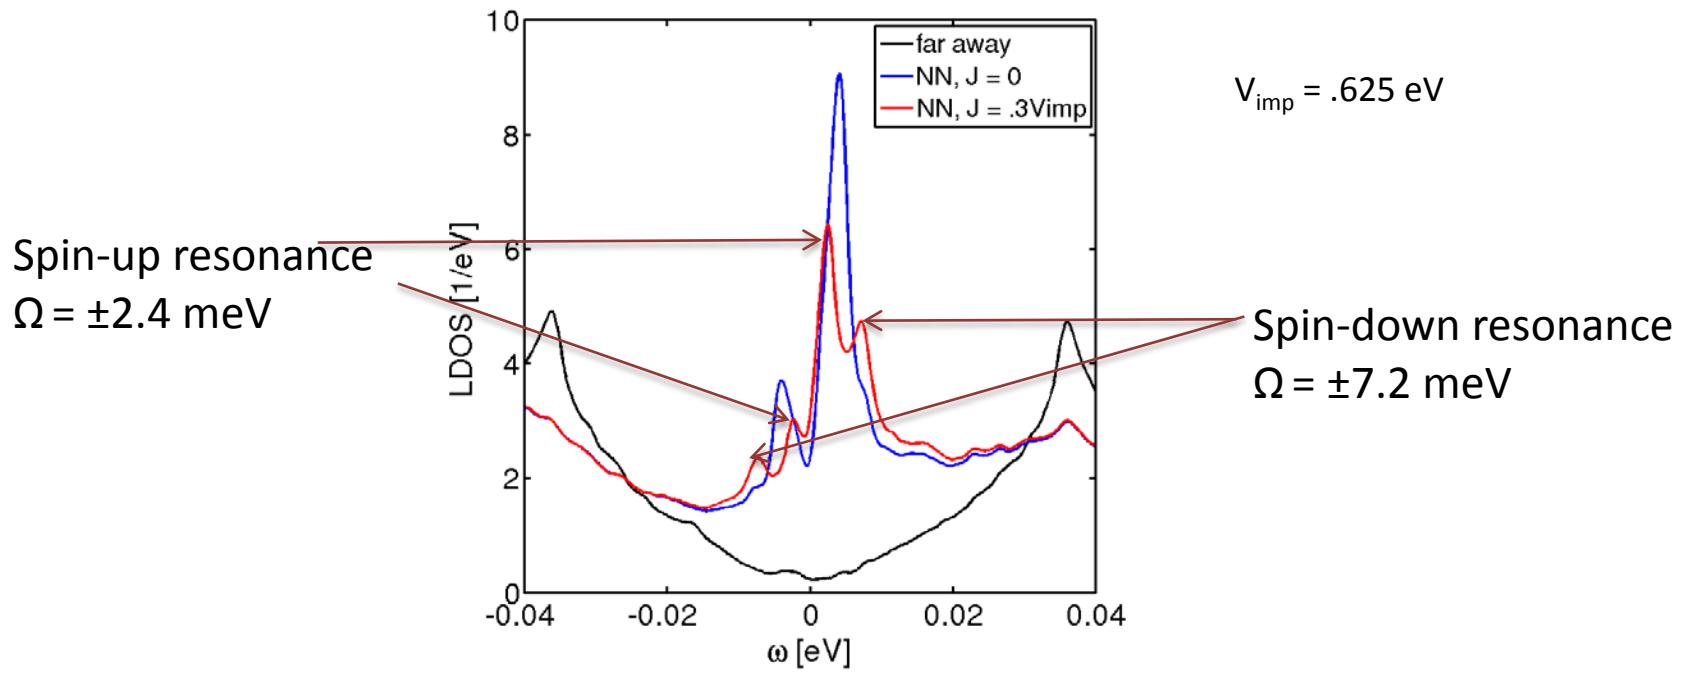

Magnetic impurity in BdG

Ni has $3d^8$ configuration which leads to magnetic moment on the impurity site ($S=1$). Approximating it as a classical spin:

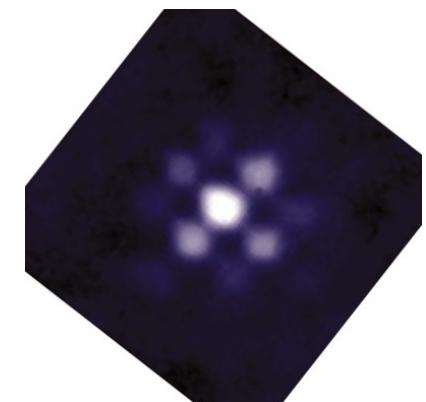

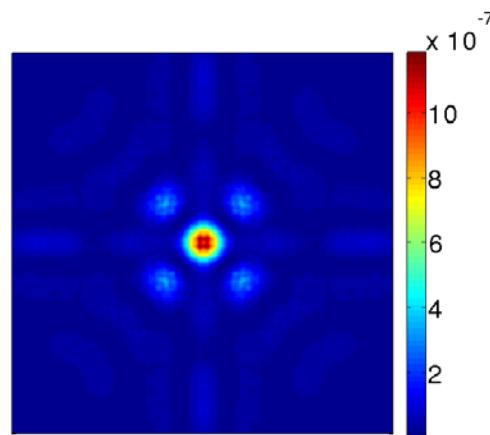

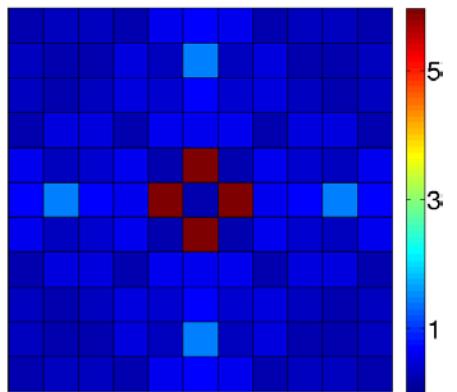

$$H_{imp}^{mag} = J(n_i^{\uparrow} - n_i^{\downarrow})$$

=> Electrons with spin up and down see effective impurity potentials $V_{imp} + J$ and $V_{imp} - J$ respectively.

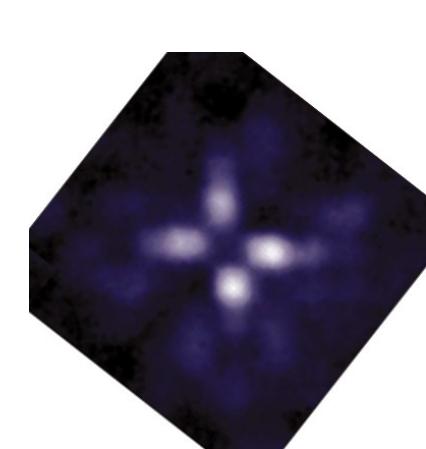

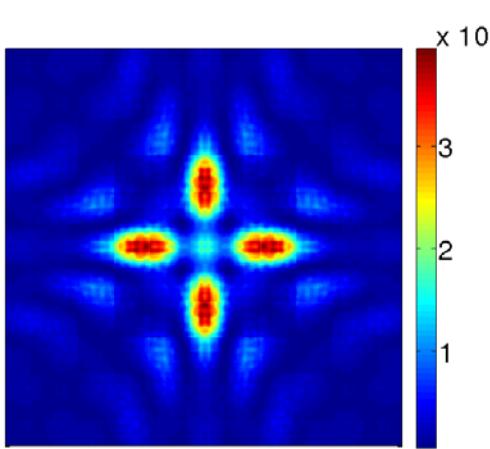

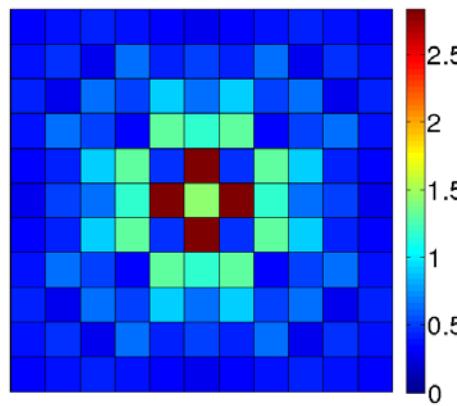

Results*: Lattice and Continuum LDOS

$\Omega = 2.4 \text{ meV}$

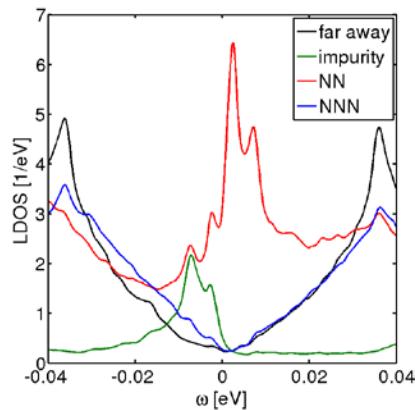

$\Omega = -2.4 \text{ meV}$

BdG+W

BdG

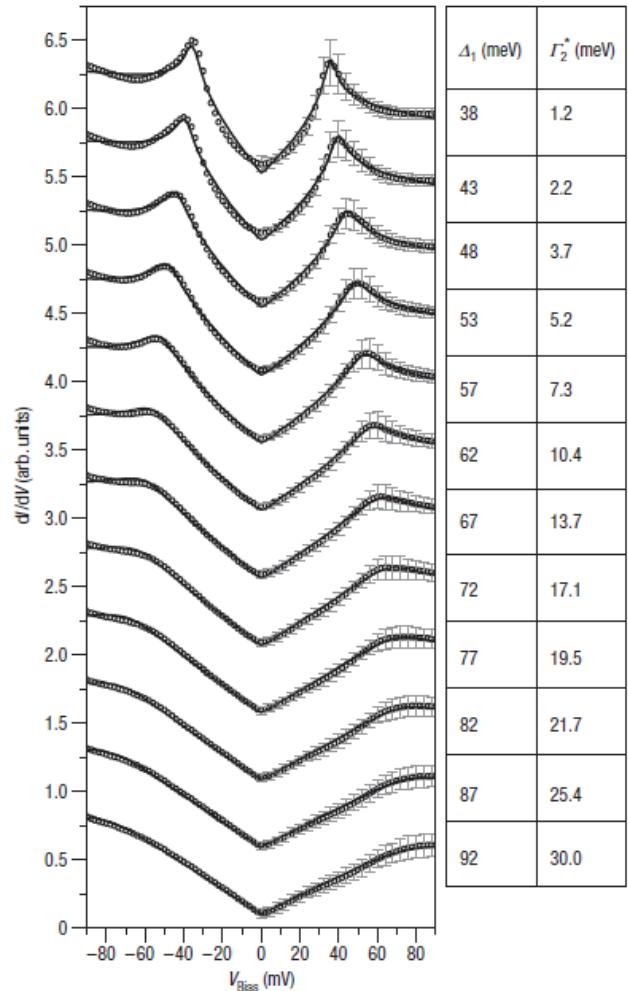

Experiment

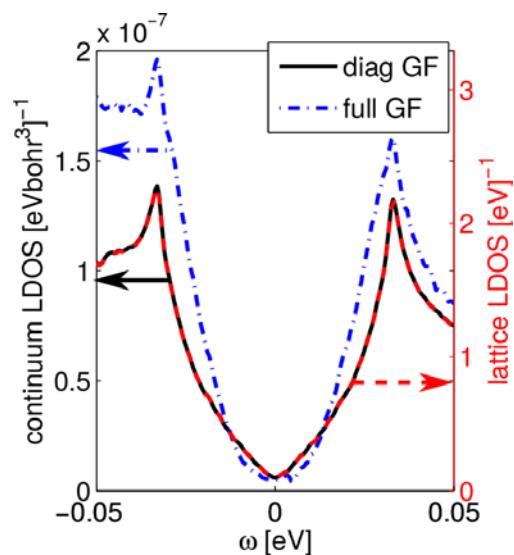

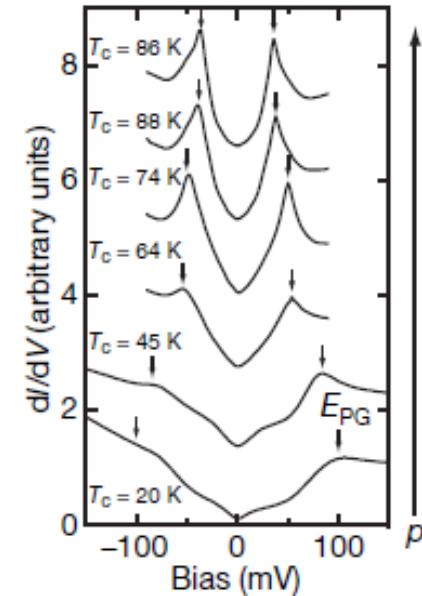

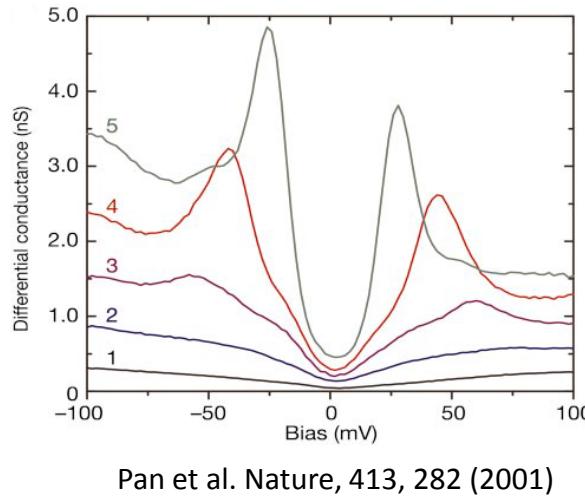

V- vs U- shape LDOS spectra

Underdoped cuprates show clean V-shape d-wave like spectrum
 Optimal-overdoped cuprates show “U-shaped” spectrum – why?

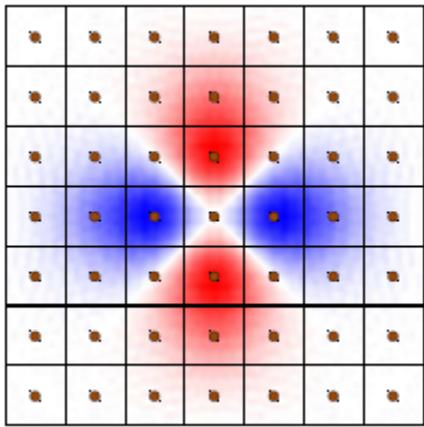

Allredge et al. Nature Physics, 4, 319 (2008)

BdG+W LDOS gives spectra resembling U-shape . What will happen if strong correlations are included?

Nonlocal contributions to local continuum Green's function

Wannier function above surface

homogeneous case:

$$G_{RR'}(\omega) = \sum_k G(k, \omega) e^{ik \cdot (R - R')}$$

$$\begin{aligned} G(r, r; \omega) &= \sum_{(RR')} G_{RR'}(\omega) w_R(r) w_{R'}^*(r) \\ &= \sum_k G(k, \omega) |w_k(r)|^2 \end{aligned}$$

where

$$\begin{aligned} w_k(r) &= \sum_k w_R(r) e^{ik \cdot R} && \text{NN} && \text{NNN} \\ &\approx a_0(r) + a_1(r)[\cos k_x - \cos k_y] + a_2(r)[\cos 2k_x - \cos 2k_y] + \\ &\quad a_3(r)[\cos 2k_x \sin k_y - \cos 2k_y \sin k_x] + \dots \end{aligned}$$

Wannier analysis: implications for “filter” mechanism

$$\begin{aligned}
 w_k(r) &= \sum_k w_R(r) e^{ik \cdot R} \\
 &\approx a_0(r) + a_1(r)[\cos k_x - \cos k_y] + a_2(r)[\cos 2k_x - \cos 2k_y] + \\
 &\quad a_3(r)[\cos 2k_x \sin k_y - \cos 2k_y \sin k_x] + ...
 \end{aligned}$$

$$\begin{aligned}
 G(r, r; \omega) &= \sum_k G(k, \omega) |w_k(r)|^2 \\
 &\approx \sum_k G(k, \omega) |a_0(r)|^2 + \sum_k G(k, \omega) |a_1(r)|^2 (\cos k_x - \cos k_y)^2 \\
 &\quad + \sum_k G(k, \omega) |a_2(r)|^2 (\cos 2k_x - \cos 2k_y)^2 + ... \\
 &\approx |a_0(r)|^2 \frac{\omega}{\Delta_0} + |a_1(r)|^2 \left(\frac{\omega}{\Delta_0} \right)^3 + O(\omega)^5 + ...
 \end{aligned}$$

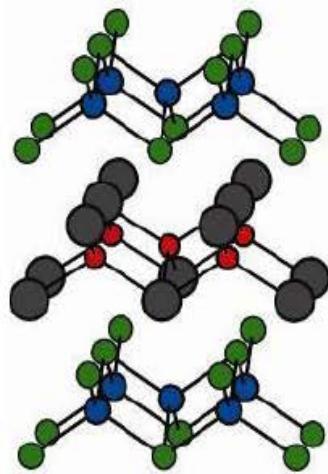

(interference terms
 vanish)

Conclude: linear- ω contribution to LDOS comes from local piece of $w(r)$
 Any purely NN “filter” tunneling mechanism (Balatsky, Ting) yields ω^3 only
 Effective Wannier function range may shrink with correlations
